ANIP primer v7.1

AI-native industrial production: VC primer

Version 7.1, dated 2026-10-27 (America/New_York). v7.1 adds a full Atomic Industries profile (section 5.11A, 13 new sources). v7 added section 1B (macro environment in depth) and section 4A (materials R&D and discovery labs), built on 68 new free sources tagged v7-sourcing. Overwritten on each rerun. Built from the anip repo: sources/ (1,437 records across all types), companies/, insights/ (signals, questions, thesis, weekly/2026-W43, producers-comparison, software-first-platforms, cross-sector-map, raising-now, repeat-orders-evidence, unit-economics, failures-and-pivots, incumbents-vs-ai-native, materials-science-semis, must-read-sources, huddle-prep). Free sources only; no AlphaSense searches run by the agent (the AlphaSense-arranged expert calls Lilly filed are used).

New to this topic? Start with section 1, section 1A (the macro primer) and section 1B (macro in depth), then come back to section 0. Acronyms are spelled out on first use and collected in Appendix A.

How to read this doc. Three kinds of statement are kept apart: - Plain sentence ending in `[src-…]` = sourced fact (a filing, release, dataset or reported figure). - **Claim (who):** = something a company, founder or expert asserted. Sourced, but not verified. - `[inference]` = my read. Not sourced; argue with it.

Confidence (`high/med/low`, per taxonomy) is marked on numbers from a deleted post, Wikipedia, Harmonic estimate or a single press article. Contradictions are shown side by side. Excluded from the category by Lilly and not covered except as failure examples: microagi, Pelico, C-Infinity, Dirac, Synera, Bright Machines (failure example only), Retrocausal, DEEP.FINE.

---

0. Decision summary

In one line: the category is real and defense demand is strong, but most buyers do not pay much for speed alone, factories must be built before contracts arrive, and nobody has yet shown that the software makes each part cheaper or better over time.

Verdict [inference]. Back capital-light owner-operators at Series B only where speed and qualification are already paid for (Senra, Freeform, Isembard, as diligence hypotheses). Use Hadrian, Divergent and SendCutSend as benchmarks. Do not pay software multiples for job-shop economics until a company shows unit cost or quality improving with volume. Nobody in the repo shows that yet.

What the 102 podcasts changed (new in v3). All 102 podcast files were read in full; the 5 points below changed the view. Each is a speaker’s claim unless marked. - **A. Speed is not worth much to most buyers.** Hadrian’s own CEO: “one of the things that I was wrong about is speed … most of the market just doesn’t value speed. The market very much values flexibility, scale, total program cost”; only one rocket company turned speed into value [src-20260921-876080]. That weakens the “speed premium” in finding 1 below beyond urgent and prototype work. - **B. Capex comes before contracts.** Power: “0% chance of growing revenue unless you spend a billion in CapEx”; only customer prepayment or long-term infrastructure credit has funded such companies [src-20260921-876080]. Machina, Divergent and SendCutSend describe the same debt-for-machines, equity-for-software split (section 2.5). - **C. Cheap labor is not the edge.** Labor is “less than 10% of COGS” in a new automated plant; China wins on a co-located supply chain (Baglino) [src-20260513-bdc044]. SendCutSend says it can beat China on only about 20-25% of its work [src-20260519-2d6ceb]. Defense

is the protected lane (section 2.4). - **D. The gate is adoption and qualification, entered through repair parts.** The Navy: “we have an adoption problem”, not a technology problem [src-20250319-f21bec]. Machina’s main product was still “in qualification phase” in April 2026 [src-20260430-30ea09]; it and Divergent enter through sustainment (replacement parts for old weapons whose suppliers are gone) [src-20251015-e9edbf][src-20260821-1c5a08]. - **E. The edge leaks both ways.** SendCutSend customers “outgrow us” by buying their own machines [src-20251002-6a5afd]. Enablers such as GrayMatter now sell turnkey robot cells “as a service” to incumbents [src-20261022-3335bd], giving old shops the same automation. Repeat-order evidence at Divergent and GrayMatter is company claims only.

What the expert calls and other sources showed.

1. **Price is not the wedge.** The only “cheaper” report (Raytheon, about 50% lower) came from RFQ (request for quote) prices before any part was delivered, on a relationship brokered by RTX Ventures, a Hadrian investor [src-20250708-2aa3ad]. A Boeing customer says Xometry is cheapest and a 20-25% price gap means re-sourcing [src-20260802-ef6506]. Three Boeing voices say parity or more: “we have actually paid probably more” (Boeing Defense head of product) [src-20260818-9b2d5c]; Hadrian priced at “PCC or slightly more” (PCC = Precision Castparts, a large incumbent supplier owned by Berkshire Hathaway) (Boeing strategy/M&A lead) [src-20250712-e5e110]. A Northrop GM: “Cost is secondary. Cost is driven usually by schedule” [src-20250707-3b7a46]. The premium buyers pay is for speed.

2. **Quality at complexity is the open risk.** “None of their parts right now are flying” (Boeing Defense) [src-20260818-9b2d5c]. “We haven’t received parts back that matched the specification” (PI, ex-Anduril hardware) [src-20250709-43486e].

3. **Share per customer is capped by design.** SpaceX caps a shop at about 1/3 of its revenue (ex-Hadrian head of engineering) [src-20250708-342eaf]. After a PCC factory fire, Boeing “will never” concentrate one part family on one supplier [src-20260818-9b2d5c]. Revenue per customer has a ceiling, so growth needs many primes [inference].

4. **The moat is workflow plus qualification, and AI CAM is coming from below.** Insiders say the edge is Opus, Hadrian’s MES (manufacturing execution system: the software that directs work on the shop floor), plus factory design, not AI that writes toolpaths [src-20260817-8867f2] [src-20261004-9b47f5]. CloudNC sells CAM Assist (AI for CAM, the software that turns a 3D model into machine instructions) to every shop and tests it in its own UK factory [src-20261009-7cafd0]. Programs last about 50 years, and suppliers for a 2035 aircraft are being chosen now [src-20260818-9b2d5c].

5. **Materials-rd budgets are not growing fast.** A former Moderna director says buyer budgets have not grown “crazily” in 5-6 years and that the gain is a “step one productivity boost” [src-20260909-af3e60] (low). An Albert Invent director says chemical majors reject royalty models (“The short answer is no”) [src-20260913-3ad55e].

6. **Fast prototype contracts hide the quality gap.** OTA contracts (Other Transaction Agreements, fast prototype contracts outside normal federal rules) waive many mil-spec (military specification) quality requirements; when programs move to standard production contracts, “there’s a gap” in statistical lot inspection (sampling batches of parts to prove they meet spec) that Hadrian “is still maturing” on. At thousands of parts its cost curve “asymptotes at a higher level” than traditional shops, and schedule is “near equal” once full inspection is counted (Boeing executive director, customer spending “low single millions” a year, “a fraction of a percent” of outside spend) [src-20260908-ed94f0]. He thinks “low tens of millions” could replicate Hadrian; a Northrop customer engineer thinks it is hard to copy [src-20260802-36d46c].

7. **Distributed networks win on urgency, not cost.** An Isembard customer paid $2,300-3,000 for 4-5 simple parts in 2-3 days that would cost about GBP150-200 in China, and sends larger batches to Chinese shops [src-20260621-f96bbd]. An Airbus Defence supply-chain head sees such networks limited to prototypes and non-critical parts while primes consolidate to fewer tier-1s [src-20251106-dfddcb].

8. **The only learning-over-time number.** Hadrian's first programming head: "within a couple of years, we saw a 50% cut" in order-to-first-article time; 70% 24-hour utilization is "very, very realistic"; pricing targets about 30% contribution margin; Opus "is replicable" and the moat is "financial power" plus a five-year head start [src-20261004-9b47f5].

9. **Hadrian's own numbers are claims, and they cut both ways. Claim (Chris Power, Hadrian CEO, on an investor-hosted panel):** "close to a billion in revenue next year", about 30% "pure software", utilization 65-80% vs about 10% at primes, "$4 of revenue on $1 of capex", labor "five to eight X more efficient … it's not about being cheaper" [src-20260610-779f8b]. **Claim (Power):** "0% chance of growing revenue unless you spend a billion in CapEx" [src-20260921-876080]. Read together: capex comes before contracts, and the software share is a stated plan, not a reported number [inference].

10. **High utilization does not need robots. Claim (Jim Belosic, SendCutSend CEO):** lasers run at 86% versus the 77% Amada promised with sheet-loader automation, and top Amada shops are "really happy if they get 50 or 60"; he rejected $4M of conveyance because high-mix, low-volume work defeats rigid automation [src-20260626-541ac8]. The edge is software-driven scheduling and quoting, not robotics [inference].

11. **Roll-up economics set the floor. Claim (Re:Build co-founder):** "effectively it's a 30% gross margin", acquisitions at "seven times EBITDA" [src-20241001-28c2aa]. That is the incumbent benchmark an AI-native plant must beat to justify venture capital [inference].

12. **Policy now buys demand, not just capacity.** The FY26 NDAA authorizes multiyear munitions procurement (Sec. 804(b)), a purchase-commitment program with advance payments (Sec. 867) and a spares review aimed at advanced manufacturing (Sec. 1842) [src-20251218-f0d6ef]. These are the first channels that could turn prototype wins into multi-year orders [inference].

Evidence on the four thesis claims (claims as numbered in insights/thesis.md)

#	Thesis claim	For	Against	Read [inference]
1	Demand for domestic production is structural	Lockheed 7-year cell deal [src-20261014-015327]; Navy $900M [src-20260320-67ba4c]; Thales CPO: capacity is the pain after COVID-era supplier bankruptcies [src-20251110-84b67e]; Boeing has used parts taken from non-flying aircraft [src-20260818-9b2d5c]	34% spindle utilization at existing shops [src-20250120-419768]; Taiwan 20-30% cheaper and Vietnam/Malaysia cheaper still [src-20250709-43486e]; Boeing makes about 40% of parts in-house and holds 6 months of inventory [src-20250712-e5e110]	True for defense capacity and speed. Commercial rate demand not shown

#	Thesis claim	For	Against	Read [inference]
2	Owning the plant creates a data loop	Freeform and Mariana score 2 (section 6). Ex-Hadrian: about 80% of non-CAM labor automated, lead times cut about 50% [src-20250708-342eaf]; reprogramming saved 50-80% of CAM time [src-20260611-7b80f0]	Toolpaths come from third-party CAM, with Vericut (simulation software) as the check [src-20260611-7b80f0] [src-20261004-9b47f5]; CMM (coordinate measuring machine) inspection is manual [src-20260817-8867f2]; a buyer asks “is it actually” software-enabled [src-20250729-a0a78c]	Workflow automation is real. Learning with volume is not evidenced
3	Moats: process data, secured capacity, qualification	Trusting a new supplier takes 5-10 years [src-20250712-e5e110]; change-of-control clauses in defense contracts (contracts that can be voided if the supplier is sold) [src-20260817-8867f2]; lock-in from 50-year programs [src-20260818-9b2d5c]	Share caps (finding 3); 90% of the first 10 Hadrian employees gone by year 5 [src-20260817-8867f2]; incumbent PCC is also automating [src-20250712-e5e110]	Qualification is a moat once paid, but it caps share. No data moat evidenced
4	Hardware-inclusive producers can return venture outcomes	SendCutSend profitable 8 years [src-20260519-38c7ed]; Hadrian plants are debt-funded [src-20260817-c48f28]	“Not … a fantastically profitable business”; a six-machine plant 1 cost “well north of $10 million” [src-20260817-8867f2]; net per-part saving after capex is 20-30% at best [src-20250712-e5e110]; Hadrian is “better suited to debt than VC” (ex-Anduril PI) [src-20250709-43486e]	Unproven. Underwrite the speed premium and the debt capacity, not cost leadership

0A. This week’s sourcing (Oct 26)

The weekly sourcing run added six sources and no new companies. The short version: **demand keeps getting stronger on paper, but the money hasn’t reached suppliers yet, and incumbents are taking share.** - **Defense money is approved in principle but hasn’t been paid out.** CNAS puts the FY27 munitions request at $49.5B, 8.5x the FY16-26 average, but 82% of it depends on reconciliation. Lead times are unchanged for 6 of 10 munitions, and production capacity is the hardest constraint to move. Framework deals with primes (Lockheed up to $9B, Northrop over $2B) are mostly unconverted [src-20261007-c6f64e]. CRS/CBO estimate a $21.7B replacement bill and say some interceptors will take at least five years to replace [src-20261005-b7e08b]. - **Bear: orders lag the budget.** Carpenter’s defense bookings fell from the prior quarter and the prior year because customers “are not receiving funds”; the CEO expects a rush once the budget clears [src-20261022-de5e6c]. Aero bookings rose 49% y/y on higher-price long-term agreements. **Claim (Carpenter):** AI productivity gains are ahead of plan (no number given). - **Bear: the incumbent distributor is gaining share.** Reliance tons rose 15.6% vs industry +10.1%. It is pricing up on extended lead times and buying domestic, and the call didn’t mention AI at all [src-20261022-1e6872]. - **Macro (BCG).**

Factory-of-the-future tech can raise productivity up to 60%, and physical AI cut robot training time about 70%. But greenfield aerospace and defense plants still favor China on cost, and tariffs can reduce the pressure to invest [src-20260528-a1c5d1]. - **Mariana podcast (all company claims, agent transcription).** Mariana has four software suites and retrofits autonomy onto equipment partly through partner firms. VC funds R&D while most mine capex comes from separate project investors. East Texas lithium goes to an unnamed battery company and ramps next year. It has two projects today against a goal of 10 [src-20261024-c53370]. - **What this means [inference]:** repeat orders in defense are likely gated by the budget until after the midterms. Ask candidates how much of their backlog is funded versus framework-only.

---

1. The thesis in plain English

What it is. AI-native industrial production means companies that build and run their own factories (or, in one variant, the software that runs other people's factories) and sell the output: parts, metal, material. The product is the physical thing; the software is how they make it faster and with fewer skilled people than incumbents. SPC's slide 8 frames it as producers "that build and run their own production capacity, using in-house AI and software to quote, schedule, and control robots and machines" [src-20261022-80fd75].

Legacy vs AI-native.

	Legacy	AI-native
Who	Job shops (small owner-run machine or fab shops that build to a customer's drawing), service centers (metal distributors that stock, cut and ship metal), brokers and marketplaces	Hadrian, SendCutSend, Senra, 1872, Nox, Mariana
Software	ERP and CAM bought off the shelf (CAM = software that turns a 3D model into machine toolpaths; ERP = the back-office system of record)	Built in-house around quoting, nesting (packing parts onto a sheet or block to minimize scrap), CAM automation, scheduling, robot control and inspection
Speed	Average aerospace part 8-12 weeks, 40% late or with quality issues [src-20251024-2e5383] (med, single memo)	**Claim (SendCutSend):** 48 hours design to delivery [src-20260227-e92d45]; **Claim (Senra):** harness lead time six months to two weeks [src-20260128-a16c79]
Learning	Knowledge sits in the heads of machinists averaging early-60s in age (**Claim, Chris Power**) [src-20260908-65fab6]	Thesis: every part made improves the next quote, schedule and QC. Evidenced at 2 of ~15 names (section 6)

Three business models (taxonomy `model`):

Model	Best example	Tradeoff
owner-operator	SendCutSend: owns all its lasers and plants, bootstrapped to a $1.01B round in May 2026 [src-20260519-38c7ed], then a Series B at $2.1B five months later [src-20261020-487a39] (med, single trade write-up)	Owns the data and the margin; carries the capex and utilization risk
software-first	Arda: CAD-to-work-instructions agent inside Anduril's ArsenalOS; $160M Series A at $1.5B [src-20261020-914a64]	Capital-light, fast to revenue; needs a host plant for data and competes with Siemens and Rockwell on the installed base [src-20250326-cc1810][src-20260804-0e8130]

Model	Best example	Tradeoff
hybrid	Hadrian (owns factories, now embeds cells inside Lockheed's Grand Prairie plant on a 7-year deal) [src-20261014-015327]; Isembard (owned plus franchised factories on MasonOS) [src-20260909-b547c7]	Tries to get owner data with partner capital; harder to underwrite because economics are split

The core tradeoff in one line: owner-operators buy data ownership and pricing power with capital intensity; software-first buys speed and margin with data dependence on someone else's plant [inference].

1A. The big picture: macro primer for a newcomer

This section assumes no background. It explains what is happening in US and allied manufacturing, why money is flowing in now, how buyers actually purchase parts, and how venture investors think about it. Every number has a source. Where a number is my reading, it says [inference].

1A.1 Manufacturing in one page

- **How big it is.** US manufacturing added $2.90 trillion of value in 2025. That is 10.1% of GDP (gross domestic product, the total value of what the economy produces). It employs 12.65 million people, at average pay of $112,261 [src-20261013-a7c995].
- **How it is organized.** Think of a pyramid. At the top are a few **primes**: the big companies that sell finished systems (a missile, a jet, a submarine) to the government. The top five US defense contractors in FY2023 (fiscal year) were Lockheed Martin ($61.4B of contracts), RTX/Raytheon ($24.1B), General Dynamics ($22.9B), Boeing ($20.1B) and Northrop Grumman ($16.3B) [src-20251215-98f650]. Below them are **tier-1 suppliers** (big sub-systems), then **tier-2 and tier-3 suppliers** (individual parts, castings, forgings, wire harnesses, raw metal).
- **The bottom of the pyramid is small and old.** The US has 17,156 machine shops. 83% have fewer than 20 employees [src-20250626-23f6d9]. They are called **job shops**: small owner-run businesses that make parts to a customer's drawing. The count is shrinking: 4,874 machine shops were lost from 2002 to 2018, about 20% [src-20250909-29c826]. **Claim (Isembard):** the average owner is over 65 and 40% plan to retire within five years [src-20260310-45bab3].
- **The top has consolidated.** Aerospace and defense primes fell from 51 to 5 since the early 1990s [src-20220215-45c353]. Fewer buyers means fewer, larger programs, and more power over suppliers.

What this means. The supply base that makes physical parts is fragmented, aging and shrinking, while the buyers at the top are few and powerful. That gap is the opening every company in this primer is trying to fill [inference].

1A.2 Why this is happening now: six forces

1. Defense needs more munitions and ships, fast. After Russia invaded Ukraine in 2022, the US and allies used up munitions faster than factories could replace them. Congress's research service says much of the concern about the defense industrial base "has focused on munitions production due in large part to high rates of expenditure" [src-20251215-98f650]. Primes are now signing long deals with new producers. Lockheed signed a 7-year deal to put Hadrian's automated machining cells inside its missile plant [src-20261014-015327]. The Navy put $900M toward Hadrian plants for submarine parts [src-20260320-67ba4c]. - *What this means:* demand is strongest for defense parts that are late today. It depends on budgets that Congress sets each year [inference].

2. China controls key inputs. China leads refining for 19 of 20 strategic energy minerals, with about 70% average share [src-20250521-c62d29]. It makes about 94% of rare-earth magnets (the strong magnets inside motors, drones and missiles) and cut magnet exports in April 2025 [src-20251103-ee9b27]. The US imports 100% of 16 mineral commodities, 67% of rare earths and 57% of refined copper [src-20260206-04fe3e]. Almost 90% of the most advanced chips are made in Taiwan [src-20230928-c47558]. - *What this means:* "Can we make this at home?" is now a national-security question, not only a cost question. That is why governments pay for domestic capacity even when it costs more [inference].

3. Tariffs make imported metal and parts dearer. Tariffs are taxes on imports. Since April 2026, products made almost entirely of steel, aluminum or copper face a 50% tariff; products that contain them face 25%; and 10% if the metal was melted or smelted in the US [src-20260402-1b5d6c]. This helps US mills: Nucor's gross margin rose from 14% to 20% (part of it a one-off refund) [src-20260812-77d6f5]. It hurts US companies that buy metal: Nucor's own fabrication segment reported "margin compression resulting from higher steel input costs" [src-20260812-77d6f5]. - *What this means:* tariffs are set by presidential proclamation and can be reversed. They are a tailwind, not a foundation [inference].

4. There are not enough skilled workers. Deloitte and The Manufacturing Institute project 3.8 million US manufacturing jobs to fill from 2024 to 2033, with 1.9 million possibly unfilled [src-20240416-b69154]. Manufacturing had 522,000 open jobs in August 2026, against a pre-pandemic average of 432,000 [src-20261013-a7c995]. The Defense Department says it needs at least 122,000 more shipbuilders, engineers and other critical workers by 2028 [src-20250101-af28c1]. - *What this means:* the bottleneck is people, not machines. Software that lets a less experienced worker do skilled work is the core promise of "AI-native" production [inference].

5. The government now lends and buys, not just regulates. Six tools matter (each explained in 1A.4): the NDAA, CHIPS, the IRA's 45X tax credit, DPA Title III, the Office of Strategic Capital and Section 232 tariffs. Together they lower the cost of building a plant and, more recently, promise to buy output for several years.

6. Money is available, but not cheap. Venture investors put large sums into this category in 2026 (Hadrian raised $1.37B in one round [src-20260807-b0dc5b]). But interest rates are rising again: the Federal Reserve raised its benchmark rate to 3.75-4.00% on September 16, 2026, saying "inflation remains elevated" [src-20260916-f0c016]. Factories are mostly paid for with loans once the first one works [src-20260817-c48f28]. Higher rates make every new plant more expensive to finance [inference].

What would reverse the trend. A defense budget cut or delay, tariffs struck down, a peace that slows munitions buying, or a jump in rates. Also: existing shops have spare capacity. The average machine in a US shop cuts metal only 34% of the time, against a 70% target [src-20250120-419768]. Some demand can be met without new factories.

1A.3 How a buyer actually buys a part (the procurement path)

This is the most important mechanism to understand. A new producer does not win "the market." It wins one part number at a time, at one buyer at a time.

1. **Request for quote (RFQ).** A buyer at a prime sends a drawing and asks suppliers for a price and delivery date.
2. **Supplier qualification.** Before a new supplier can make flight or weapon parts, the buyer checks its quality system. The common standard is **AS9100**, the aerospace quality management standard. Special processes (heat treating, coatings, inspection) need **NADCAP** accreditation.

Buyers told us qualification takes 9-12 months at Raytheon [src-20250708-2aa3ad] and 1-2 years at Northrop [src-20260802-36d46c].

3. **First article inspection (FAI).** The supplier makes the first part. Every dimension, material and process is checked against the drawing and written up in a standard report (AS9102). FAI is repeated whenever the design, material, process, tool or location changes, or after two years without production [src-20190801-e81d7b]. *This is why moving a part to a new supplier is slow and costly.*
4. **Prototype and low-rate production (LRIP).** Small quantities, often under fast contracts such as **OTAs** (Other Transaction Agreements, which skip much of the normal federal acquisition rulebook and can roll into production without a new competition) [src-20241219-9f8fcc].
5. **Rate production.** Steady, high volume. Here price per part and consistent quality decide who wins. A Boeing executive says at around 1,000 parts a traditional shop is cheaper than Hadrian [src-20260908-ed94f0].
6. **Repeat orders and multiyear contracts.** The prize. Programs can last about 50 years, and suppliers for a 2035 aircraft are being chosen now [src-20260818-9b2d5c]. The FY26 NDAA (National Defense Authorization Act, the yearly defense policy law) now allows multiyear buying for SM-6, Tomahawk, AMRAAM, JASSM, LRASM and PAC-3 missiles [src-20251218-f0d6ef].

Two rules that limit any one supplier. Buyers cap how much they depend on one shop (SpaceX caps a shop at about 1/3 of its revenue) [src-20250708-342eaf]. After a factory fire at a major supplier, Boeing says it “will never” put one part family with one supplier again [src-20260818-9b2d5c].

What this means. Early wins are fast prototype work that buyers pay a premium for. The test of a real business is whether those wins turn into repeat rate-production orders. That is exactly Lilly’s question 1, and the evidence so far is thin (section 8) [inference].

1A.4 The policy toolkit, in plain English

Tool	What it is	What it does for producers	Source
NDAA	The yearly law that sets defense policy (not the money itself; money comes in separate appropriations bills)	FY26 version: multiyear munitions buying (Sec. 804(b)); an Industrial Base Fund for castings, forgings and machine tools, with purchase commitments of up to 10 years and advance payments (Sec. 867); a review of which spare parts advanced manufacturing can make (Sec. 1842)	[src-20251218-f0d6ef]
DPA Title III	Defense Production Act of 1950. Title III lets the government pay to expand domestic capacity: direct purchases, purchase commitments, even installing equipment in private plants	23 awards, $820.5M since Jan 2025, mostly rare earths and rocket motors; none yet to the startups we track	[src-20251215-98f650][src-20261019-68fd3d]
OSC	Office of Strategic Capital, a Defense Department lender created in 2022. It makes loans and loan guarantees for 34 critical technology areas, including advanced manufacturing	$620M loan to Vulcan Elements for a magnet plant; FY2026 funding of $97.8M can back up to $4.4B of loans, and the 2025 reconciliation law adds credit subsidy for up to $100B each for critical minerals and covered technologies	[src-20251103-ee9b27][src-20260908-f6558e]

Tool	What it is	What it does for producers	Source
CHIPS Act	2022 law: $52.7B for FY2022-2027 for US chip factories, research and workforce	Mostly helps chip fabs; it co-funded the Vulcan magnet deal with a $50M incentive	[src-20230928-c47558][src-20251103-ee9b27]
IRA 45X	A per-unit tax credit from the 2022 Inflation Reduction Act for US-made energy components. Critical minerals earn 10% of production costs	The 2025 tax law (P.L. 119-21) phases the minerals credit out 2031-2034 and bars Chinese-linked supply chains	[src-20251001-45a0c1]
Section 232	A 1962 law letting the President set tariffs on national-security grounds	50/25/10% metals tariffs (see 1A.2)	[src-20260402-1b5d6c]
Buy American / Specialty Metals	Laws requiring the Defense Department to buy US-made goods; specialty metals (titanium, nickel, some steels) must be melted in the US	Protect domestic demand for metal and parts	[src-20251215-98f650]

What this means. Policy is strongest for metals and minerals (loans, credits, tariffs). For machined parts, policy works mainly through prime contracts and the new multiyear authorities [inference].

1A.5 How big is the market?

No free source gives a clean market size (TAM, total addressable market) for “AI-native production.” What we have: - All US manufacturing: $2.90T value added [src-20261013-a7c995]. - Metal service centers (distributors that stock, cut and ship metal): about $200B of revenue (med) [src-20251201-4b732d]. - Precision manufacturing: about $71B by 2026, machine-shop segment over $60B (med, one analyst memo) [src-20251024-2e5383]. - Global industrial robot installs: $18.6B in 2025, a proxy for automation spending [src-20260924-28b59b].

Section 3 has the full table. *What this means:* the markets are large, but each startup sells into a narrow slice (one part type, one buyer group). Share per buyer is capped (1A.3), so growth needs many buyers [inference].

1A.6 How venture investors see it

- **It costs a lot to build.** A first six-machine factory cost “well north of $10 million” [src-20260817-8867f2]. Hadrian’s Mesa plant was about $200M [src-20250820-cfbf02]. Software companies do not need this.
- **Margins are lower than software.** Gross margin is revenue minus the direct cost of making the product, as a share of revenue. Software companies often run far higher than manufacturers. Benchmarks here: Proto Labs 44.5% [src-20260206-8bb619]; Xometry’s marketplace 34.7% [src-20260224-a7b149]; metal service centers 18-32% [src-20260729-407fd7][src-20261021-16bb64]; a manufacturing roll-up “effectively … 30%” (claim) [src-20241001-28c2aa].
- **Who pays for what.** Venture equity pays for the team, the software and the first plant. Banks, equipment lenders and the government pay for plants two and beyond, once a plant is proven. Hadrian: “equity never funds factory construction” (claim) [src-20260807-b0dc5b]; it has a $360M bank credit line [src-20260817-c48f28].
- **The bull case.** If software lets one plant run at much higher utilization with fewer skilled workers, it can earn better margins than a job shop and win share. **Claim (Chris Power, Hadrian CEO):** utilization of 65-80% versus about 10% at primes [src-20260610-779f8b].
- **The bear case, with equal weight.** Several buyers say they pay the same or more, not less (section 0). Some see these firms as “better suited to debt than VC” [src-20250709-43486e]. Recent failures: Daedalus (an AI-run machining factory) went insolvent in August 2026 [src-

20260801-4532f6]; Markforged went from a $2.1B valuation to a $42.5M sale [src-20261023-63156a]; Bright Machines' SPAC (a listing via a shell company) fell through [src-20240527-6a4884].
- **Exits are unproven.** The repo has no acquisition of an AI-native producer above $100M (Appendix B). Likely exit paths are sale to a prime or incumbent supplier, an IPO (stock listing) at scale, or continued private ownership with debt [inference].

What this means for SPC. The question is not "is manufacturing coming back?" It is "can a software-run plant earn better margins than a job shop, and turn fast prototype wins into multi-year orders?" Everything after this section tests that [inference].

1B. The macro environment in depth (new in v7)

Section 1A gives you the one-page version. This section goes slowly through every big force acting on US industrial production in late 2026. For each one it says what the policy or fact is, how it works in plain English, what it means for an AI-native factory, and what to watch. Every number carries a source ID. Anything marked `[inference]` is my read.

The short version [inference]. Four things are true at once: 1. Washington is spending, lending and even taking equity at a scale not seen since the Cold War. That money goes to anyone who can produce metals, magnets, munitions and chips in the US. 2. Building a factory has got more expensive and more uncertain. Rates went back up, metal tariffs raise input costs, and construction spending on manufacturing plants is falling. 3. China has shown it will cut off critical minerals, and the current pause on those controls expires in weeks. 4. Labor is the binding constraint, not demand.

AI-native producers sell into the first and third points and are hurt by the second. Their pitch on labor (fewer, more productive people) only works if the software is real.

1B.1 Industrial policy: what changed between 2022 and 2026

From grants to stakes. The CHIPS Act of 2022 gave about $39B of manufacturing incentives and $11B of R&D money, run by NIST at Commerce [src-20220511-6efadf]. Under the current administration the tools have changed more than the money has. The government now takes equity. Commerce turned Intel's CHIPS grants into a 9.9% stake: $8.9B for 433.3M shares at $20.47 a share [src-20260726-39275b]. Fortune counts about $26.7B of US government equity across roughly 30 deals, including $400M in MP Materials, and notes how hard the stakes are to track [src-20260726-39275b]. - **Why it matters [inference]:** a startup that becomes a "national champion" for one material can now get the government as a shareholder and an anchor buyer. The flip side is that the state also picks winners, and a competitor it picks can crowd you out.

CHIPS is ending. According to the Congressional Research Service, FY2026 was the last year of appropriated CHIPS manufacturing money. The 35% advanced-manufacturing investment tax credit (48D) covers only projects that start construction by December 31, 2026 [src-20260701-78183b]. The CRS report tracks fab-by-fab status: several big fabs have slipped or been rescoped, and the window for new projects to qualify closes in about nine weeks [src-20260701-78183b]. - **For our companies [inference]:** semiconductor-adjacent materials startups (Periodic, CuspAI, Orbital) are selling into an industry whose subsidy flow peaks now. After 2026 the growth has to come from AI demand, not from subsidies.

IRA to OBBBA. The One Big Beautiful Bill Act (OBBBA, July 2025) cut back much of the Inflation Reduction Act (IRA), but kept the 45X production credit for components (battery cells, modules, critical minerals and others) [src-20250608-08074e]. Here is what changed, per Miller & Chevalier [src-

20250608-08074e]: - Most 45X phase-downs now begin in 2030. Wind components lose the credit after 2027. - A product gets no credit if it receives “material assistance” from a prohibited foreign entity (in practice, Chinese-linked inputs or ownership above set thresholds). - Metallurgical coal was added as a critical mineral that qualifies. - Critical minerals keep the credit longer than most components.

Bonus depreciation is now permanent. OBBBA made 100% first-year (“bonus”) depreciation permanent for qualifying property acquired after January 19, 2025. IRS Notice 2026-11 sets out the guidance [src-20260114-2075f7][src-20260101-08d847]. - **Plain English:** a manufacturer that buys a $2M machine can deduct all $2M from taxable income in year one, not over 7–10 years. That makes machines cheaper after tax for any profitable buyer. - **For our companies [inference]:** this is quietly one of the most helpful policies for owner-operators like Hadrian, SendCutSend and Senra once they pay tax. It helps profitable incumbent job shops even more, since they can use the deduction now. It also makes it cheaper for an incumbent to buy robots, which narrows the startups’ edge.

1B.2 The government as lender and investor: OSC, EDF and DPA Title III

There are three federal “banks” for industry. Founders mix them up; investors shouldn’t.

1. Office of Strategic Capital (OSC), Department of Defense. - **What it is:** a DoD lender created in 2022 to make loans and loan guarantees for “critical technologies” in the defense supply chain. - **Recent deals:** in June 2026 OSC issued conditional loans of $725M to Energy Fuels and $500M to Phoenix Tailings (rare-earth metal and magnet feedstock; facility due 2028), about $1.2B in total [src-20260618-184e0c]. It made an earlier $150M loan to MP Materials [src-20260807-110c13]. - **New fund-finance program:** OSC opened a program to lend $500M–$1B per fund to private investment funds that back critical-technology companies. Applications are due November 1, 2026, and commitments are expected by March 10, 2027 (Mintz) [src-20260831-4dd3b7]. - **The FY27 budget request** includes about $20B of mandatory money for OSC [src-20260831-4dd3b7]. - **Quote (Breaking Defense):** an OSC official said that without germanium, gallium and rare earths, the defense-production buildout “is a pipe dream” [src-20260618-184e0c]. - **What it means [inference]:** for a capital-heavy producer (Vulcan, Mariana, a casting or forging startup), OSC debt can replace 30–60% of the equity it would otherwise need. That is a real reason VC returns in this space can beat their history. For SPC specifically, the fund-finance window is worth a look on its own: it is leverage for funds, not just for companies.

2. Office of Energy Dominance Financing (EDF), formerly the DOE Loan Programs Office (LPO). - **What it is:** DOE renamed LPO as EDF. Its leadership says it has more than $289B of loan authority and is restructuring about $83B of Biden-era loans and conditional commitments [src-20260116-27c00a][src-20251217-51eb2f]. - **Where the money is going:** toward nuclear, grid, fossil and critical minerals. Mayer Brown lists $17.5B conditional for Westinghouse AP1000 long-lead components and $26.5B to Southern Company, among others [src-20260804-05a6a5]. - **For mineral developers:** EDF wants offtake contracts, a proven technology and US content. Mayer Brown lays out what developers need to bring [src-20260804-05a6a5]. - **What it means [inference]:** EDF debt fits late-stage plants, not Series A companies. But a reactor buildout means years of demand for forgings, castings, valves and precision parts, which is exactly what Hadrian-, Freeform- and Divergent-style producers sell.

3. Defense Production Act (DPA) Title III and the Industrial Base Fund. - **What it is:** DoD grants and purchase commitments to create or expand domestic capacity. - **Examples:** the critical-minerals factbook lists DPA, DLA (Defense Logistics Agency) stockpile orders for magnets, and CHIPS awards, including USA Rare Earth’s $277M grant plus a $1.3B loan [src-20260807-110c13]. The FY2026 NDAA added munitions-automation and Industrial Base Fund sections [src-20251218-f0d6ef].

Executive orders on critical minerals. The March 2025 order (“Immediate Measures to Increase American Mineral Production”) speeds up permits and directs DPA and DFC financing toward minerals [src-20250320-91988a]. The April 2025 order opens offshore and seabed minerals [src-20250424-a310b3]. - **What it means [inference]:** permitting speed is the policy most likely to matter for a mine or refinery startup. A permit that takes 3 years instead of 10 changes the net present value more than any grant.

1B.3 China and the critical-minerals squeeze

Where things stand (late October 2026): - **April 2025:** China put export licensing on 7 heavy rare earths and the magnets made from them (MOFCOM Announcement No. 18). That rule is still in force [src-20261019-854e22][src-20250414-50f023]. - **October 2025:** China added broader controls, including rules that reach foreign products containing Chinese rare earths (Nos. 55–58, 61, 62). Under the US–China truce, Announcement No. 70 suspended them until **November 10, 2026**. No extension text has been published as of October 19. The US side says the truce runs to January 10, 2027 [src-20261019-854e22]. - **Gallium, germanium and antimony:** China’s outright ban on exports of these to the US is suspended until **November 27, 2026** [src-20261027-f82d55]. - **Exports are already down:** China’s rare-earth exports fell 9.6% year on year in January–September 2026 [src-20261019-854e22]. - **Germanium price:** a record ¥28,500/kg on October 26, up about 110% year to date. Material held in US warehouses trades at a 78.6% premium. China makes about 60% of refined germanium [src-20261027-f82d55]. - **Forecast:** Strature puts a 63% probability on a short roll-over of the suspensions and spells out what happens if they lapse [src-20261016-83adeb] (med; one forecaster).

Why defense cares. CSIS points out that China did about 99% of heavy rare-earth processing until 2023, and that rare earths go into the F-35, Virginia- and Columbia-class submarines, Tomahawk missiles and JDAM bombs [src-20250414-50f023].

How big the risk is. The IEA’s critical-minerals outlook estimates that about $6.5 trillion a year of downstream economic output depends on minerals with concentrated supply chains. It also finds that planned magnet capacity outside China would meet only about a third of 2035 demand [src-20261014-b9d647].

What it means [inference]: 1. Any startup producing rare-earth metals, magnets, gallium or germanium in the US has a buyer of last resort in the US government and a very strong story. 2. The risk goes both ways. If China floods the market after a deal, prices collapse, as they have before. Producers need floor-price offtake contracts (the MP Materials–DoD template) or they get crushed. 3. Discovery labs also have a real pitch here: “design out” the scarce element. Examples are magnets without heavy rare earths, catalysts without platinum-group metals, and Orbital’s PFAS-free fluids. This is the strongest commercial reason for materials AI right now (see section 4A).

Watch: November 10 and November 27, 2026.

1B.4 Tariffs and input costs

- **Section 232 metals tariffs:** Proclamation 11021 (April 2026) set 50% on steel, aluminum and copper, 25% on derivative products and 15% on some industrial machinery. A June 2026 proclamation adjusted them further [src-20260602-b995e2].
- **Input-cost inflation:** ENR reports construction material prices up 55.5% since February 2020. Steel mill products are up about 86% and copper wire about 91.4%. Tariff-exposed materials pushed input prices higher in early 2026 [src-20260302-477c5f][src-20260708-da5010].
- **Energy:** ENR also notes an energy-price spike tied to the Iran conflict [src-20260708-da5010].

- **What it means [inference]:** tariffs help a US producer by making imported parts dearer. They hurt by raising the cost of the steel and aluminum it buys and the machines it installs. The net effect is positive for finished parts (fabrication, machining) and mixed for anyone who buys a lot of metal and sells into price-sensitive markets. Tariffs can also be reversed overnight, so a model should never assume they last.

1B.5 Capex, construction and rates

- **Factory construction is cooling:** US manufacturing construction spending was $202.4B (annualized) in December 2025, almost 16% below its August 2024 peak, and down 21.9% year on year by May 2026 [src-20260302-477c5f][src-20260708-da5010].
- **Data centers are crowding it out:** data centers make up about 35% of contractor backlogs [src-20260708-da5010]. They compete with factories for electricians, switchgear and power.
- **Rates went back up:** on September 16, 2026 the Fed raised its target by 25bp to 3.75–4.00%, by a 12–0 vote, citing inflation that is still elevated [src-20260916-f0c016].
- **Activity is still strong:** the ISM manufacturing PMI was 54.5 in September 2026, the ninth straight month above 50 (expansion). New orders were 55.3, backlog 56.4, and prices paid 77.9 [src-20261008-89df84]. Deloitte's 2026 outlook notes the PMI was below 50 for most of 2025 [src-20251112-669746].
- **What it means [inference]:**
    1. Demand for parts is good: orders and backlogs are both above 50.
    2. Building new plants is harder. It is costlier to finance and costlier to build.
    3. The CHIPS and IRA-era plant boom is past its peak.
    4. This favors capital-light models: robotized brownfield shops and roll-ups of existing shops (Amca) over greenfield megafactories. It also explains why customers keep pushing suppliers to hold inventory.

1B.6 Defense and munitions budgets

- **The FY27 request:** CNAS counts $49.5B of procurement for 10 key munitions in FY27, about 8.5 times the FY16–26 average of $5.8B [src-20261007-c6f64e].
- **The catches** [src-20261007-c6f64e]:
    - About 82% of the money depends on a reconciliation bill passing.
    - Lead times have not improved for 6 of the 10 munitions.
    - Production capacity is the hardest constraint to move.
    - The war with Iran used up more than half of the US stock of high-end interceptors.
    - CNAS calls the budget "necessary but insufficient."
- **Contracts:** framework agreements with the primes (multi-year deals) are mostly not yet converted into contracts while the FY27 bill is pending [src-20261007-c6f64e].
- **What it means [inference]:** this is the single biggest demand driver for AI-native precision parts, energetics, castings and forgings. But the money is back-loaded and political. A startup should show signed sub-tier purchase orders from the primes, not just "the budget is huge." Watch the reconciliation vote.

1B.7 Labor: the real binding constraint

- **The gap:** Deloitte and the Manufacturing Institute estimate that US manufacturing will need 3.8M workers by 2033, and that 1.9M of those jobs could go unfilled [src-20240403-f5594a].
- **Talent is the top problem:** in 2024, 65% of NAM survey respondents named attracting and keeping workers as their top business challenge [src-20240402-b9644b].
- **Technicians:** a 2026 Deloitte/MI study projects 2.3M technician openings by 2030, with about 500k open today. Technician roles are growing about 6 times faster than other manufacturing jobs. It also argues that AI can speed up skills training [src-20260910-b300bf].

- **Spending plans:** 80% of manufacturers plan to put at least 20% of their improvement budgets into smart manufacturing [src-20251112-669746].
- **What it means [inference]:** the pitch to buyers is not “cheaper labor.” It is “we can deliver when your job shop can’t hire.” A producer whose software lets one machinist run 4–6 machines, or a fabricator whose quoting runs itself, sells capacity in a capacity-short market. That is why “owner-operator” beats “software to the plant”: the incumbent plant often can’t staff enough people to use the software.

1B.8 Venture climate

- **AI dominates:** US VC deal value hit $515.8B through Q3 2026, with AI taking 82.7% of it. Exits are still stalled (PitchBook-NVCA) [src-20261008-8f7d66].
- **Defense tech:** a record $2.5B in Q3 for defense-specific startups, led by Castelion ($1.1B) and Mach ($900M). Seed deals fell to 41, the fewest since 2016 [src-20261006-0f220a].
- **Concentration:** one tracker counts $14.6B of defense-tech funding year to date, against $9.6B for all of 2025, with deal count flat. The money is going to fewer winners [src-20260908-abd0c7].
- **What it means [inference]:** the dollars are concentrating in late-stage “AI” and “defense” labels, and seed is getting thinner. That creates two opportunities: (a) better seed and Series A prices for producers that don’t fit the hype labels; (b) a risk that the best AI-native producers are priced as AI companies. Lila, CuspAI and Periodic valuations are an example (section 4A).

1B.9 Science policy: the Genesis Mission, DOE, NSF and the national labs

- **What it is:** the Genesis Mission (EO 14363, November 24, 2025) tells DOE to build an integrated AI platform for science. It links national-lab supercomputers, datasets and robotic labs. Named priorities include advanced manufacturing, critical materials, semiconductors and energy [src-20251124-b97a20].
- **Platform demo (July 2026):** a Model Access Gateway to frontier models, simulation agents, national-lab datasets and DOE-built Model Context Protocol (MCP) tools, with open protocols for outside tools [src-20260722-edf40f].
- **Awards (October 8, 2026):** 12 new Phase II awards worth $159M, for 14 Phase II projects in total. The first-year cohort has 297 projects. Materials examples include rare-earth separations at UIUC and quantum magnets at ORNL [src-20261008-452806].
- **Hackathon (October 21, 2026):** 450+ participants and 185 projects, backed by $1M of compute and 55k DOE compute hours [src-20261021-4b8e0f].
- **NSF:** spends more than $700M a year on AI research [src-20261019-5257f3].
- **Existing ties:** national-lab self-driving labs such as Argonne’s Polybot [src-20250217-059784] and Sandia’s partnership with Radical AI on hydrogen-purification alloys [src-20260929-dfb65a] show that labs are already working with startups.
- **What it means [inference]:** Genesis is both a funder and a competitor for discovery startups. It gives free compute, data and test beds, and partnerships like Radical–Sandia. It also builds free public models, tools and data that weaken the “proprietary model” moat. Startups win on what they make and qualify, not on the model.

1B.10 Macro scorecard: tailwind or headwind for each layer [inference]

Force	Metals supply	Fabrication	Precision parts	Materials R&D	Factory software
OSC/EDF/DPA money	Strong +	Mild +	+ (via defense)	Mild +	0
China mineral controls	Strong +	0	Input-cost −	+ (“design out”)	0
Section 232 tariffs	+	+	Mixed	0	0

Force	Metals supply	Fabrication	Precision parts	Materials R&D	Factory software
Rates 3.75–4.00%	− (capex heavy)	Mild −	Mild −	− (long horizon)	0
Construction slowdown	Mild −	−	Mild −	0	− (fewer new plants)
Munitions budget	+	+	Strong +	Mild +	Mild +
Labor shortage	Mild −	+ (automation edge)	Strong +	0	+
100% bonus depreciation	+	+	+	0	+ (buyers' capex)
CHIPS sunset	0	0	Mild −	− (semis buyers)	0
Genesis / national labs	Mild +	0	0	± (funder and competitor)	0
VC concentration	− (seed)	−	Hype pricing	Hype pricing	−

What would change the macro picture [inference]: a lasting US–China minerals deal (bad for domestic premiums); the reconciliation bill failing (munitions money slips); rate cuts in 2027 (good for capex-heavy names); a tariff rollback by court or deal (hurts fabrication pricing).

2. Why now: the drivers in detail, ranked

Section 1A gave the short version. This section gives the evidence for each driver. They are ranked by how much each one moves revenue for the companies we track [inference on the ranking]. Each driver ends with "what this means", in plain words.

2.1 Defense demand (structural for 5-10 years; budget swings at the margin)

How it works. The US is buying more missiles, ships and drones than its factories can make. The big contractors ("primes", such as Lockheed and Raytheon) cannot add qualified suppliers fast enough. So they are signing multi-year capacity deals with new producers. - Lockheed signed a 7-year deal to put Hadrian's automated machining cells inside its missile plant (PAC-3, THAAD, PrSM and GMLRS missiles), starting early 2027 [src-20261014-015327]. The Navy put $900M next to more than $1.5B of Hadrian money for three plants making submarine parts [src-20260320-67ba4c]. Divergent will build Tomahawk structures for RTX [src-20260601-976843] and is opening a Long Beach plant sized for 30,000 missile airframes a year [src-20261023-e02543]. The Army chose Vulcan Elements for magnets for a 1M-drones-a-year program [src-20260923-c53c99]. - **Claim (Chris Power, Hadrian CEO):** labor hours per submarine rose from about 13M to more than 70M, and the enterprise is about 50M labor hours a year short [src-20260610-779f8b]. - **Navy, on the record:** a NAVSEA (Naval Sea Systems Command) official says more than 100 ships are on contract and 55 are in construction. He also says: "I do not believe we have a technology problem, we have an adoption problem." One recent boat carries more than 100 critical parts made by 3D printing, and the Navy has spent more than $200M on it, but getting the technical authority to approve those parts took time [src-20250319-f21bec]. The nuclear supply chain shrank from more than 17,000 suppliers to about 5,000 [src-20250319-f21bec]. - **The catch: demand is lumpy. Claim (Power):** the government pays once a year and "may not buy missiles next year" [src-20260908-65fab6]. On an Air Force panel, Divergent's CEO said "the big thing is always demand signal", and a Boeing-owned satellite maker said "cadence and multi-year contracts develop capacity" [src-20260504-38bee3]. A Raytheon manager reports suppliers at 80-90% utilization with 9-10 months for castings [src-20250708-2aa3ad]. - **What this means [inference].** Demand is real, but qualification (getting each part approved) is the gate, and it is slow. Multi-year contracts (section 10) are what turn demand into factory loans.

2.2 Skilled labor (structural), and why cheap labor is not the point

How it works. Factories cannot hire enough machinists, welders and programmers. Software that makes tasks easier lets people with no factory background do the work. - Headline numbers are in section 1A.2 (Deloitte: 3.8M jobs needed). A 2026 Deloitte follow-up counts 2.3M technician openings for 2025-2030 but leaves out machinists, so do not add the two [src-20260910-a2cd42]. - **Claims (owner-operators):** Hadrian trains new operators in 30-40 days instead of a decade [src-20260926-70087f]. SendCutSend hired 200 welders in a year, mostly people with no factory experience; average floor age is about 25 [src-20260525-4a12ab]. Shipyard starting pay is about $22-23 an hour and average tenure is about 4 years (Navy panel) [src-20250319-f21bec]. - **The important correction.** Drew Baglino (ex-Tesla, now Heron Power): in a new automated factory, in China or the US, “the labor differential is less than 10% of COGS” (cost of goods sold), maybe under 5%. What makes China cheaper is that its supply chain sits close together: all ~7,000 car parts within a 3-hour drive [src-20260513-bdc044]. **Claim (Belosic, SendCutSend):** a dark (fully automated) factory is not the answer; his edge is software plus well-paid people [src-20260519-2d6ceb]. - **What this means [inference].** Saving on wages alone will not beat China. The edge is having enough trained people at all, plus being close to customers and suppliers.

2.3 Tariffs (policy-driven; reversible)

How it works. Section 232 (a 1962 law letting the President set tariffs for national security) raised steel and aluminum tariffs from 25% to 50% in June 2025. Since April 6, 2026: 50% on goods made almost entirely of steel, aluminum or copper; 25% on goods that contain them; 10% if the metal was melted in the US. Grid equipment gets 15% until 2028 [src-20260402-1b5d6c]. - Who wins and loses: Nucor (a steel mill) cites the tariffs for fewer imports; its gross margin rose to 20% from 14%, though about 1.3 points came from a one-off refund. Its own fabrication unit reported “margin compression” from costlier steel [src-20260812-77d6f5]. Reliance (a metals distributor) says aluminum prices are “historically elevated largely due to” the tariff [src-20260728-ae7dea]. - **What this means [inference].** Tariffs help metal makers and hurt metal buyers, including fabrication startups. The 10% vs 25% gap rewards suppliers who can prove where their metal was melted, which favors software-native firms.

2.4 China and offshore competition (structural), split by market

How it works. China makes most of the world’s magnets and refines most critical minerals (section 1A.2). On ordinary commercial parts it is usually cheaper. The split that matters is protected versus open markets. - **Protected markets (defense).** Defense buyers are barred by DFARS (defense purchasing rules) from buying from a “foreign entity of concern”, so price against China does not decide the sale [src-20250429-6f9155]. ITAR (an export-control law) keeps defense work onshore too. **Claim (Ed Mehr, Machina CEO):** “if you go head-to-head with China … you’re losing”, so Machina starts in defense, which “won’t source from China” [src-20260622-7846f9]. - **Open commercial markets. Claim (Belosic):** SendCutSend can “meet or beat China” on only about 20-25% of its work [src-20260519-2d6ceb]; customers “shop with their wallet” and will offshore “when the price is half” [src-20251002-6a5afd]. An ex-Anduril hardware lead says Taiwan is 20-30% cheaper and Vietnam and Malaysia cheaper still, even with tariffs [src-20250709-43486e]. Counter-claim: Isembard says it beat Chinese shops “on speed and cost” for a jet-engine customer (unnamed) [src-20260909-b547c7]. - Commercial buyers do pay for “insurance”: the 2021 chip shortage showed a few hundred dollars of parts can stop an $80,000 car (**Claim, Vulcan CEO**) [src-20250429-6f9155]. - **What this means [inference].** Defense is the protected lane where US producers can win. In commercial work they win only where speed or supply security matters more than price.

2.5 Money: capex before contracts, and debt versus equity

How it works. A factory must be built before a buyer will sign a production contract, because the buyer wants proof the supplier can deliver. That means spending large sums (“capex”, capital expenditure on buildings and machines) years ahead of revenue. - **Claim (Power):** “0% chance of growing revenue unless you spend a billion in CapEx because no one’s going to give you a production contract unless you’ve already started executing.” Capex runs about 2 years ahead of revenue, and Hadrian was “underwater on financing costs” until late Series B. Only two capex-heavy models have worked: the customer prepays (NASA with early SpaceX; “Pentagon doesn’t do this”) or long-term infrastructure credit [src-20260921-876080]. - **Debt versus equity.** Equity (selling shares) is expensive money; debt (loans) is cheaper but needs assets or contracts behind it. **Claim (Mehr):** “don’t fund physical hardware with equity”; Machina’s machine loans cost about 2-3% over the prime rate [src-20260220-0d5345][src-20260320-1361e2], a good package about 8-9% and a risky one 12-14% [src-20260430-30ea09]. Hadrian has a $360M bank revolver (a reusable credit line) [src-20260817-c48f28]. - **What banks will not fund. Claim (Belosic):** lenders fund machines but not the software team or R&D [src-20260519-2d6ceb]; banks lend only on common, resaleable machines, so custom lines (anodizing, casting) are “unfinanceable” [src-20260624-3dc6f7]. - Venture and government: Hadrian’s $1.37B Series D [src-20260807-b0dc5b]; OSC (the Pentagon’s lender) lent Vulcan $620M [src-20251103-ee9b27]. **Claim (Dayna Grayson, Construct Capital):** later-stage industrial funding was about $3B in 2021 and has grown about 10x in 4 years [src-20260702-d79e75], which means more competition for deals [inference]. The Fed raised rates to 3.75-4.00% on Sep 16, 2026 [src-20260916-f0c016], which makes plant loans dearer [inference]. - **What this means [inference].** Equity pays for software, the team and the first plant; loans and government pay for later plants once contracts exist. A company without contracts is stuck paying equity prices for steel.

2.6 Power, permits and build time (a hard limit)

How it works. A factory needs a large electricity hookup and permits. Both can take years. - **Claim (Belosic):** “We need 100 times more power”; Reno warehouses lack electrical service; transformers and permits are delayed; “everyone wants to re-industrialize, but we don’t have the power” [src-20260519-5cfe14]. - **Claim (Vulcan CEO):** “if you can’t get a permit for several years … running out of cash”; and most magnet-making equipment itself comes from China [src-20250429-6f9155]. Permits for identical equipment take “3 weeks, 3 months, or 3 years” depending on the town (Torus, Utah panel) [src-20260813-1fe8a2]. - **Claim (Mariana CEO):** after permits, a mine or refinery can take about 5 years to build and 3-5 years to ramp [src-20260513-bdc044]; Chinese refineries commission in about 6 months versus 2-4 years in the West [src-20250723-3f3ef8]. - **What this means [inference].** Speed to build and ramp is itself a competitive edge, and power is a site-selection question for every plant.

2.7 AI and robotics (enabling, not sufficient)

- US robot installs grew 12% to 38,428 in 2025 [src-20260924-28b59b]. LLM agents now read CAD and write work instructions (Arda: 10 hours to 15 minutes at Anduril) [src-20261020-914a64]. Freeform runs GPU clusters on site to control each printed layer [src-20260219-2125d7].
- Limits: US metalworking robot adoption is only about 3,000 units a year [src-20260618-c903cc]. Robot learning succeeds about 59-66% of the time on a new task versus 99.9%+ needed on a line [src-20260904-267293]. **Claim (Mehr):** physical AI is at “2007-2008 of LLMs” [src-20260220-0d5345]. **Claim (Nox Metals CEO):** “AI just doesn’t know so much of the nuance” of a factory [src-20260325-5b68db].
- **What this means [inference].** AI makes office work around the machine (quoting, programming, instructions) faster today. It does not yet run the machines on its own.

2.8 More macro facts a newcomer should know

- **The munitions gap, in numbers. Claim (Power):** the US buys about 100 Tomahawks a year, versus about 850 fired in one day in the Iran conflict; Ukraine used three years of missile inventory in about six weeks [src-20260908-65fab6]. Lockheed has $60B+ of Pentagon deals to triple PAC-3 output from about 600 to 2,000 a year (trade press) [src-20261015-86f700].
- **Who really makes defense parts. Claim (Power):** 60-80% of a prime's output comes from small-business suppliers, which face payment terms of about 300 days which makes them hard to finance [src-20260908-65fab6]. The F-35 relies on "7,100 mom and pop shops" (**Claim, Nox CEO**) [src-20261022-3135b5]. The NDIA's president (ex-Pentagon) says sub-tier suppliers run batches "of 10 or 20", and their real question is "will you keep buying them from me", which is why five-year purchase guarantees matter [src-20260901-a44eee].
- **China's dependence, inside US weapons. Claim (Power):** of about 1,000 components in a Navy missile, "probably 150" come from China; about 70% of drone components come from China or Taiwan [src-20260610-779f8b]. China produces 56% of world castings, and the Pentagon relies on a single US foundry for large titanium parts (General Catalyst thesis) [src-20240202-8c6d3b]. China makes over 90% of rare-earth magnets; the US under 1% [src-20250429-6f9155].
- **The US lost its machine-tool industry.** US machine-tool shipments fell from $5B (1981) to $2B (1983); half of US machine-tool firms closed in 1982-87; imports rose from about 10% to about 60% by the late 1990s [src-20240118-4e5ac1]. So even AI-native US factories buy German, Japanese or Italian machines [src-20260310-f52a8d].
- **Labor numbers, freshest first.** In a Q3 2026 NAM survey of 220 manufacturers, 54.9% cite workforce as a top challenge and 4.79% of jobs sit unfilled [src-20260914-b4d55c]. The American Welding Society expects 320,500 welders needed by 2029, with 157,000+ near retirement [src-20261023-57ad95]. US factory labor costs about $46.30 an hour fully loaded, rising 3-4% a year, while a robot fell from $46,000 (2010) to $23,000 (2022) (newsletter) [src-20260826-14e4bb].
- **Precedent: the government has funded capacity before.** In the 1950s the Pentagon paid $239M (about $2.8B today) for 10 giant forging presses and leased them to industry for 4-5% of revenue [src-20240821-44ed1d]. Today's equivalents are OSC loans and Sec. 867 purchase commitments (section 10).
- **Demand from AI data centers.** An AI campus can need up to 50,000 t of copper and 200,000 t of steel; steel prices rose 25% in a year (Robeco) [src-20261007-a642ea]. A legacy fabricator building generator enclosures for Amazon, Google, Apple and Meta has "backlogs working on 2027" (**Claim**) [src-20261022-4234b3]. Bear: AI capex is estimated at 3.63% of GDP, above the railroad boom's 2.24%, and most hyperscalers have near-zero free cash flow [src-20261015-c425a9]. If AI spending slows, this demand pocket shrinks [inference].
- **What this means [inference].** The shortage is in sub-tier suppliers and skilled hands, and buyers' stop-start ordering is what keeps small shops from investing.

What would break "why now"

- Tariffs reversed or limited by courts (they are proclamations, not laws) would hit metals and fabrication first [inference].
- A flat defense budget or delayed munitions buys would strand plants built ahead of contracts (section 2.5).
- Higher rates raise the cost of the loans that fund plants #2+ [inference].
- Spare capacity exists: the average CNC spindle at existing shops cuts metal 34% of the time versus a 70% target [src-20250120-419768] (med, survey). The US lost 4,874 machine shops (-20%) from 2002 to 2018 [src-20250909-29c826].

3. Market size by layer

How to read this. “TAM” (total addressable market) means the total money spent on something each year. No layer here has a clean, free TAM. Where we only have a stand-in number (a “proxy”), we say so.
The whole sector. US manufacturing added $2.90T of value in 2025, about 10.1% of GDP. It employs 12.65M people, paid $112,261 on average [src-20261013-a7c995] (high).
Layer by layer.

Layer	Best free number	What it does not tell you	
Metal distribution	About $200B revenue across about 9,400 sites; the top 50 firms hold about half (2025) [src-20251201-4b732d] (med)	Excludes refining	
Metal refining	No market size found. Public money committed to minerals: $65B (2025) [src-20260716-6a06e4] (high)	US refining TAM is a gap	
Machine shops (precision parts)	17,156 sites, 223,313 workers, $14.23B payroll; 83% have under 20 staff; down from 17,433 in 2022 (2023) [src-20250626-23f6d9] (high). IBISWorld counts 16,619 [src-20260201-adef50] (med)	Counts, not revenue	
Precision parts (estimate)	About $71B by 2026; machine shops over $60B [src-20251024-

2e5383] (med) | One analyst memo; its sources were not traced | | Fabrication | Structural and architectural metal: 14,533 sites, 423,013 workers, $28.26B payroll; sheet metal 4,652 sites; structural fab 3,434 (2023) [src-20250626-23f6d9] (high) | No free revenue number | | Materials R&D | None in the repo | Gap | | Factory software | Robots installed worldwide worth $18.6B (2025) [src-20260924-28b59b] (high) | Robot spend, not software spend |	
The market is fragmented. Most shops are tiny: 83% of US machine shops had under 20 staff in 2023 [src-20250626-23f6d9]. At the top it is the opposite: defense primes fell from 51 to 5 since the 1990s [src-20220215-45c353].	

What this means [inference]. The pools are large but split among thousands of small shops. That makes room for a new entrant, but no one can say how big the winnable slice is.

4. The five layers

How to read this. We split the category into five layers, from raw metal at the bottom to factory software at the top. Each layer makes money differently. “Gross margin” is the share of revenue left after the direct cost of making the product.

4.1 Metals supply (mining, refining, magnets, metal distributors)

- **Who:** Mariana Minerals (copper, lithium; runs its own mines) [src-20260803-30e6d5]. Vulcan Elements (NdFeB, i.e. rare-earth, magnets) [src-20251103-ee9b27]. Nox Metals (automated metal distributor; we passed) [src-20261009-404b9b]. Candidates: Hertha (iron and steel), Cyclic, Mass Magnetics, Duranium. Established players: Reliance, Ryerson, Nucor, MP Materials.
- **How it makes money:** a “service center” buys metal in bulk, cuts it and resells it. Gross margins run about 18-32%: Ryerson 17.7% (Q2 2026) [src-20260729-407fd7]; Reliance 27.9% or 31.6% depending on inventory accounting (LIFO or FIFO) (Q3 2026) [src-20261021-16bb64]. Refining margins: no data.
- **What AI changes: Claim (Mariana):** its software halves project timelines that normally take 5-10 years [src-20260803-30e6d5]. Its mine is about 50% autonomous, with AI agents (reinforcement learning, “RL”) adjusting the process every 15 minutes [src-20260623-d1790b]. **Claim (Nox):** a price quote in minutes, versus 3-5 days at brokers [src-20250813-5ee11b].
- **Risks:** metal prices swing; permits are slow; buyers are concentrated (Vulcan sells mostly to government) [src-20251103-ee9b27].
- **What this means [inference]:** government support is strongest here (OSC loans, tariffs, IEA finance).

4.2 Fabrication (cutting, bending and welding sheet metal; wire harnesses)

- **Who:** SendCutSend [src-20260519-38c7ed]; Senra (wire harnesses, the bundled cables inside machines) [src-20260701-027c1b]; Machina Labs (robots that shape sheet metal) [src-20260204-ce7053]; 1872 (robotic steel fabrication) [src-20260722-985690]. Atomic Industries (AI-designed injection molds plus its own molding presses; section 5.11A) [src-20261027-b51989]. Candidate: Advanced Metal Research.
- **How it makes money:** SendCutSend has been profitable for eight years [src-20260519-38c7ed]. Revenue is about $140M a year per a since-deleted post (low) [src-20260504-c3ded5], or “nine digits” per Sequoia’s Reed [src-20261020-487a39] (med).
- **What AI changes:** instant online quotes, and software that packs many customers’ parts onto one metal sheet (“nesting”). **Claim (Senra):** quotes in about a day and 99% first-pass yield (FPY: parts that pass inspection the first time) [src-20260701-027c1b].

- **Risks:** works for small batches, not mass production. Machina takes 30 minutes to hours per part; a stamping press takes seconds [src-20261023-c3b62f].
- **What this means [inference]:** the best layer for capital-light owner-operators, but volume is capped.

4.3 Precision parts (CNC machining, 3D printing, castings, composites)

CNC means computer-controlled cutting machines. “AM” (additive manufacturing) means industrial 3D printing. - **Who:** Hadrian [src-20260807-b0dc5b]; Divergent [src-20250915-311606]; Isembard (franchise network) [src-20260909-b547c7]; Freeform (metal 3D printing) [src-20260219-2125d7]; Amca (buys and upgrades old shops) [src-20260520-af3e6c]; Fabri (castings) [src-20260617-4dfb96]; Layup (composites) [src-20260602-a7b79e]; Hybron [src-20260413-abc797]. Established players: Howmet, PCC, ATI, Carpenter, Proto Labs, Xometry. - **How it makes money:** Proto Labs’ gross margin was 44.5% in 2025 [src-20260206-8bb619]: 49% from its own factories versus 31% from its partner network [src-20260206-2b13c7]. Xometry (an online marketplace) earns 34.7% [src-20260224-a7b149]. Howmet’s engine unit earns 37.7% before interest, tax and depreciation (EBITDA) [src-20260806-9a83f7]. **Claim (Rolls-Royce engineer):** small shops aim for low double-digit margins [src-20251120-0c271b]. **Claim (ex-Hadrian programming head):** a typical shop can go from 15% to 30% margin in 12-18 months with Hadrian-style operations [src-20261004-9b47f5]. - **What AI changes: Claim (Raytheon manager):** Hadrian quoted about 50% lower prices at about a third of the lead time [src-20250708-2aa3ad]. Other buyers disagree (section 8). - **Risks:** buyers must approve each new supplier. That takes 9-12 months [src-20250708-2aa3ad] or 1-2 years at Northrop [src-20260802-36d46c]. (AS9100 is the aerospace quality standard; NADCAP certifies special steps like heat treating and NDT, non-destructive testing.) The leader is valued at $7.87B, out of SPC’s range [inference]. - **Failures in this exact model:** Daedalus, an AI-run CNC factory in Germany with a $21M Series A, went insolvent in August 2026 [src-20260801-4532f6][src-20251203-fc28ea]. VulcanForms replaced its founder CEO [src-20240919-72efcc], then raised $220M [src-20260130-365541]. An ex-Hadrian engineer: a six-machine first factory cost “well north of $10 million”, and “manufacturing is not actually a fantastically profitable business” [src-20260817-8867f2]. - **What this means [inference]:** the biggest and most contested layer; the top names are already expensive.

4.4 Materials R&D (robot labs that use AI to discover new materials)

- **Who:** Periodic Labs [src-20261022-682e62]; CuspAI (software only) [src-20261022-37a0ea]; Radical AI (runs its own lab) [src-20260617-f9d293]; Lila Sciences (candidate). Nearby: Microsoft Discovery, Citrine.
- **How it makes money: Claim (CuspAI primer, AlphaSights):** custom projects earn 5-15% gross margin, a software platform 85-90%; 40-50% of pilots convert to contracts [src-20261016-29997e] (med).
- **What AI changes: Claim (Radical):** tests 8-20 alloys a day, aiming for 100; $60-300 per experiment; samples from grams to 500 g; no manufacturing yet [src-20260617-f9d293]. **Claim (Periodic):** at full speed, 4 months of experiments in under 2 weeks [src-20260917-1bcb81].
- **Risks:** none of the three discloses revenue; valuations of $2.6B-$7.5B come before product [inference]. The science has a mixed record. Berkeley’s A-Lab claimed 41 new materials; an outside critique said “no new materials were discovered” (challenged, not retracted) [src-20240124-513fd9]. MatterGen handles only about 20 atoms per unit and needs checking by physics simulation (DFT) [src-20261022-3e2a9d]. Lila’s catalysts are untested in a real electrolyzer [src-20261019-392916]. An Albert Invent director says chemical majors refuse royalty deals and their problem is “millions of SKUs” (product variants), not crystal structures [src-20260913-3ad55e].
- **Buyer views (expert calls).** A former Moderna director: buyers reach these labs through contract research firms (CROs) and pay per successful candidate. He says CuspAI won 8 of the

last 10 campaigns, Radical 1 and Lila 1 (claim). He ranks long-run potential Radical > Lila > CuspAI > Periodic, and says CRO bookings were “very bad” in 2024-25 [src-20260909-af3e60] (low: hard to check). The Albert Invent director (a competitor, so biased): annual contracts run from hundreds of thousands to millions of dollars; procurement “shut[s] down” big prices; budgets open when a product launches in “one-third the number of iterations”. He splits $100 as CuspAI $50, Lila $35, Periodic $15 [src-20260913-3ad55e].

- **What this means [inference]:** interesting science, but these are research shops, not producers, and buyers’ budgets are small. **Full treatment in section 4A (new in v7).**

4.5 Factory software (tools sold to other companies’ plants)

MES (manufacturing execution system) is the software that tracks and directs work on a shop floor. It is the established category. - **Who:** Arda (turns CAD design files into work instructions) [src-20261020-914a64]; Mind Robotics (robot AI models; The Verge corrected “spinoff” to “a partner of Rivian, but not a spinoff”) [src-20261013-cc78c0]; candidates Rapta, Allus, Faraday. Established: Siemens, which bought Altair and Dotmatics [src-20250326-cc1810][src-20250701-a7fef9], and Rockwell (gross margin 49.5%) [src-20260804-0e8130]. - **How it makes money: Claim (Arda):** priced by usage [src-20261020-a1e174]; no revenue disclosed. - **What AI changes:** AI agents that write work instructions are the only shipped product (Arda at Anduril) [src-20261020-914a64] [inference]. - **Risks:** Siemens and Rockwell own the customer relationships, and the host plant owns the data [inference]. An investor says the AI is not the limit; the value needs connected plant data and new workflows [src-20261006-6265ad]. Mind has raised over $1B and shown no robot publicly [src-20261013-cc78c0]. Bright Machines, an earlier “software-defined factory”, failed to go public via SPAC (a shell-company merger) and pivoted to assembling AI servers [src-20240926-fd90fb]. - **Enablers arm the incumbents.** GrayMatter Robotics tried selling autonomy software, found “that model doesn’t really work”, and now rents turnkey sanding and painting cells “as a service” [src-20261022-3335bd]. **Claim (GrayMatter):** Riddell went from about 300 to 1,700 helmets a day on the same robots after software updates [src-20261022-3335bd]. If old shops can rent this, automation alone stops being an edge [inference]. - **AI for machine programming and inspection.** CAM is the software that turns a 3D model into machine instructions. CloudNC’s CAM Assist writes basic machining plans in minutes inside GibbsCAM, with a human checking each step; CloudNC tests it in its own factory [src-20261021-9769d1][src-20261009-7cafd0]. AI Robotics, a Korean university spinout, inspects welds on 24 production lines in 3 countries, using over 4M data points [src-20261011-a8b14d]. Both sell the same tools to incumbents [inference]. - **What this means [inference]:** this layer sells “picks and shovels”. It may help old shops catch up as much as it helps new ones.

4A. Materials R&D and discovery labs: the full picture (new in v7)

Lilly’s v6 feedback was that materials R&D (Radical AI, CuspAI and their peers) was the biggest gap. This section covers the whole sub-sector. It is kept **separate from the producers** in sections 4–5 on purpose. Most discovery labs do not run a production plant floor, so they fail the category’s producer test. The exceptions are the owner-producers below (Orbital, Mitra Chem). They still matter to SPC for three reasons: 1. They are where much of the “AI for the physical world” money is going. 2. A few are turning into producers. 3. The materials they design flow downstream to the fabricators and machinists we do back.

4A.1 What “AI materials discovery” means, in plain English

A new material (an alloy, a battery cathode, a catalyst, a coolant, a magnet) normally takes 10–20 years and tens of millions of dollars to go from idea to qualified product. Discovery labs try to compress that with three tools: 1. **Generative and predictive models.** Software proposes candidate structures

and predicts their properties, so you test hundreds instead of millions. Examples: - Microsoft's MatterGen is a diffusion model trained on about 608k stable materials. It generates crystal structures to a target property [src-20250116-63e766][src-20261022-3e2a9d]. - Google DeepMind's GNoME predicted 2.2M crystals, about 380k of them stable. Outside labs have since made 736 of them [src-20231129-1dc706]. - Meta's open OMat24 dataset holds more than 110M quantum-mechanics (DFT) calculations [src-20130101-5e5543]. 2. **Self-driving labs (SDLs).** Robots mix, synthesize and test the candidates, and the results feed back into the model. Examples are Berkeley's A-Lab, Argonne's Polybot [src-20250217-059784] and Radical AI's alloy lab. 3. **The closed loop.** Model proposes, robot makes and measures, model updates. The claim is that each turn makes the next guess better, so the lab gets faster over time. This is the materials version of the "data loop" in section 6.

The key point [inference]: models are becoming free. GNoME, MatterGen, OMat24 and the Genesis Mission platform are all public or close to it. The scarce assets are (a) physical throughput, meaning how many real samples you can make and test, (b) data that is proprietary and tied to real-world performance, and (c) the ability to scale up and qualify a material with a customer. That is where the right to win sits.

4A.2 The map: four business models

Model	What they sell	Examples	Producer test?
1. Software / SaaS	Data platform and AI tools to the R&D teams of chemical and materials companies	Citrine, Uncountable, Kebotix (status unclear), Albert Invent, Microsoft Discovery	No
2. Discovery-as-a-service / IP	Custom discovery projects, licensing and royalties, with partners making the material	CuspAI, Periodic, Lila (materials arm), Aionics, Dunia	No
3. Lab plus government / partner contracts	Its own SDL; paid by defense and labs, then licensing or making specialty material	Radical AI	Partly (makes alloys at small scale)
4. Owner-producer	Designs the material **and** makes and sells the product	Orbital Industries, Mitra Chem	Yes, closest to the thesis

4A.3 Company profiles

Radical AI (New York; alloys and metals; model 3). - **Funding:** $55M led by RTX Ventures [src-20250718-d46f24]. An Air Force AFWERX Direct-to-Phase II contract worth $1,197,902 [src-20250825-300a14]. - **Technology:** its AI engine, "Antimatter," drives a self-driving alloy lab. TIME named it one of the Best Inventions of 2026 [src-20261020-055082]. - **Lead material, RAI-939:** a high-temperature refractory alloy. A Purdue Applied Research Institute torch test found about 125 times the survivability of C103, the incumbent niobium alloy (company release reporting Purdue's test) [src-20260807-52b690]. **Claim (Radical):** about 300 alloys made in 16 weeks, in a space where only 3,493 alloys had been studied in 20 years. It is now scaling up to bigger test articles and building spec-sheet data [src-20260807-52b690]. - **Partnerships:** Sandia National Laboratories, on alloys for hydrogen purification [src-20260929-dfb65a]. A Makino partnership on machining [src-20261022-e2876c]. - **Throughput: Claim (Krause):** 8–20 alloys a day, aiming for 100; $60–300 per experiment; samples from grams to 500 g; no manufacturing yet [src-20260617-f9d293][src-20260710-366df7]. - **What it means [inference]:** the clearest defense-led path. Hypersonic and propulsion alloys have a buyer (RTX and the Air Force) and a clear test (the torch test). The risk is the jump from a 500 g button to qualified mill product, which needs a melter and forger partner.

CuspAI (Cambridge, UK; sorbents, membranes, chemicals; model 2). - **Funding:** $450M Series B (Kleiner, NEA) [src-20260720-840ae3]. - **Partners:** about 30 industry and 15 lab partners, including Samsung, AMD, Lam and Applied [src-20261022-37a0ea]. Its "AI Materials Foundry" consortium has

45+ members. - **Kemira PFAS project:** a sorbent to remove “forever chemicals” from drinking water. About 300 trillion structures searched, 5,000+ designs generated, about 20 candidates made and tested, all in 6 months. Kemira calls it an “industry first” commercial partnership and says further projects are being scoped [src-20260521-f4b51b]. - **Singapore:** a five-year, multi-program partnership with A*STAR and a new office there [src-20260723-f1e4f1]. - **Economics (expert call, AlphaSights):** custom projects earn 5–15% gross margin and the platform 85–90%; 40–50% of pilots convert. Royalties are talked about at about 1% (bulk) and 3–5% (specialty), but customers often refuse to give up data rights [src-20261016-29997e] (med). - **What it means [inference]:** the best commercial traction in the group, with a named buyer (Kemira) and a regulatory driver (PFAS rules). But CuspAI is a design shop: Kemira makes and sells the product, and CuspAI’s take is a royalty or fee.

Periodic Labs (San Francisco; semiconductors, superconductors, magnets; model 2). - **Funding:** $300M seed, September 2025 [src-20251022-8eb7c0]; reportedly raising more (med) [src-20260514-5796ab]. - **Go-to-market: Claim (Periodic, via Heard In):** acts as its own “customer zero.” It sends forward-deployed engineers, runs models on the client’s site and fine-tunes on the client’s data. Its first focus is semiconductor heat dissipation [src-20261008-38b3d6]. Its website lists magnets, semiconductors and superconductors, plus a Montreal ML office [src-20261001-e0573e][src-20261007-13c943]. - **Critique:** the VC newsletter VCA notes “nothing published yet” and no customers named [src-20261011-bf3574]. - **Speed claim:** 4 months of experiments in under 2 weeks at full speed [src-20260917-1bcb81]. - **What it means [inference]:** the most “frontier lab” of the group (OpenAI and DeepMind alumni). It is priced on talent; commercial proof is the least public.

Lila Sciences (Cambridge, MA; “scientific superintelligence,” life sciences and materials; model 2). - **Funding and site:** $550M raised and a new 250k sq ft site in Cambridge [src-20260610-21e4df]. Reportedly in talks at about $8.5B (Bloomberg, via repo notes). - **Catalysts (company claim):** 2,942 catalysts screened in 3 months, across six palladium-based families. The best matched ruthenium after more than 1,000 hours of testing. 17 times faster, with over 90% less hands-on time [src-20260925-679418]. Still untested in a real electrolyzer [src-20261019-392916]. - **mRNA (company claim):** 950k+ sequences tested, and an in vivo CAR-T program done in 6 months for about a tenth of the usual cost [src-20260828-66bafe]. - **Quote (CTO, Ray Summit):** only about 5% of science is “cheap to verify,” which limits how far AI alone can go [src-20260917-29aa29]. - **What it means [inference]:** most of the value is in biology. Materials is a second line. Not an industrial producer.

Orbital Industries (formerly Orbital Materials; London and Princeton, NJ; model 4). - **Funding:** $50M Series B led by Plural, May 28, 2026; about 50 staff [src-20260528-93befb][src-20260528-375aec]. - **Model:** it is vertically integrated and sells products, not software. The two products are a PFAS-free dielectric cooling fluid for data centers and “Nova Array,” a modular data center it says can be deployed in 180 days [src-20260528-93befb]. - **Commercial status:** a multi-year AWS partnership. The fluid is in qualification with chip makers, a contract manufacturer is lined up, and the target is to ship alongside 2027 GPUs [src-20260528-375aec]. - **Claims: Claim (CEO Godwin):** the traditional way would take “10 years and $100M” [src-20260528-375aec]. **Investor view (Plural):** there is “no AlphaFold moment for materials,” so value comes from owning the product [src-20260528-2c20ee]. - **Licensing:** it licensed its CurieOS platform to BASF [src-20261022-edad3e]. - **What it means [inference]: the most thesis-aligned name in the section.** It found a buyer with an urgent need (data-center cooling), chose a product it can make through a contract manufacturer, and owns the margin. If the fluid ships in 2027 it could be among the first AI-designed materials sold at scale. Diligence: who the CMO is, qualification status, gross margin per liter.

Mitra Chem (Mountain View, CA; LMFP and LFP battery cathodes; model 4). - **History:** began shipping LMFP cathode samples to global customers in 2023 [src-20240611-24c650]. Series B led by GM. - **Production: Per BusinessPost (Korean):** a $100M DOE production grant, $50M from Michigan’s MSF fund, and a planned 30k-ton-a-year, $370M LFP plant in Michigan. Korea’s L&F invested

$10M for about 3.3%, and the two are considering a joint-venture plant [src-20260831-db47e6] (med; single foreign-language article). - **Earlier reporting:** TechCrunch on generative AI in battery development [src-20231014-d1a13f]. - **What it means [inference]:** an AI-designed chemistry turning into a chemical plant, so it does pass the producer test. But it competes on cost per kWh against Chinese LFP, which is the hardest market in industry. Its value depends on 45X and the foreign-entity rules (section 1B.1).

Other names. - **Citrine Informatics:** materials-informatics software (model 1). **Claim:** 380 projects, 550 models and 70k experiments a month. Customers include Huntsman and Perstorp, with DARPA INTACT and ARPA-E work [src-20261022-267188][src-20260902-224ead]. Last raise was a $16M Series C in 2023 (search; low). - **Uncountable:** R&D data platform for formulations (model 1) [src-20260101-850ff7]. $27M Series A in 2025 (search; low). - **Kebotix:** AI plus robotic chemistry. Johnson Matthey project on catalytic-converter coatings in 2021 [src-20210803-6788dd]. Current status unclear. - **Aionics:** AI for battery electrolytes. **Claim:** screens about 3,000 formulations a second. Partners include Porsche's Cellforce, earlier with Form, Resonac and Cuberg. It sends samples to the customer and scales through manufacturing partners [src-20231014-d1a13f][src-20261016-29997e]. - **Dunia:** an autonomous electrocatalyst lab (IRIS). **Claim:** "20 years to 2" [src-20261023-b4535c]. Raised €11.5M in 2024 (search; low). - **Big tech:** Microsoft (MatterGen, Discovery), Google DeepMind (GNoME, plus an automated materials lab in the UK [src-20251211-cb7237]) and Meta (OMat24, OMol25 [src-20250513-fbb4d8]). They give away the model layer.

4A.4 From discovery to production: the valley of death

The steps, with typical time in brackets [inference, built from sources cited]: 1. **Compute screen** (weeks): the model narrows millions of candidates to hundreds. Now cheap. 2. **Synthesis and first tests** (months): grams to 500 g in an SDL. This is the step labs speed up 6–17 times. An RSC benchmark finds a median speedup of about 6 times over random sampling (search; low), and Lila claims 17 times [src-20260925-679418]. 3. **Scale-up** (1–3 years): kilograms to tons. It needs process chemistry or metallurgy, and a pilot line. Radical's RAI-939 is at this step now [src-20260807-52b690]. 4. **Qualification** (1–5 years): the customer tests the material in its own product against specs. Aerospace alloys need allowables databases. Chip fluids need qualification by the fab or GPU maker (Orbital, 2027 target [src-20260528-375aec]). Water sorbents need regulatory approval (Kemira). 5. **Supply** (ongoing): someone has to make it reliably at cost. This is where the margin is, and where owner-producers sit.

Where AI helps: step 1 a lot, step 2 a lot, steps 3–5 little. Steps 3–5 are most of the time and money. That is why Plural says there is "no AlphaFold moment" [src-20260528-2c20ee], and why the Lila CTO says only about 5% of science is cheap to verify [src-20260917-29aa29].

4A.5 Unit economics and who pays

- **Software (Citrine, Uncountable, Albert):** annual contracts in the hundreds of thousands to low millions of dollars per enterprise. Procurement pushes back on high prices [src-20260913-3ad55e]. Gross margins are software-like, but the market is capped by R&D budgets.
- **Discovery projects (CuspAI, Periodic):** 5–15% gross margin on custom work, 85–90% on the platform. Conversion of 40–50% of pilots. Royalties of about 1% (bulk) to 3–5% (specialty), often refused [src-20261016-29997e] (med). Chemical majors refuse royalty deals [src-20260913-3ad55e].
- **Per-candidate (pharma-style):** buyers come through CROs and pay per successful candidate [src-20260909-af3e60] (low).
- **Government:** AFWERX awards of about $1.2M [src-20250825-300a14]; Genesis Phase II awards averaging about $13M ($159M across 12) [src-20261008-452806]; ARPA-E and DARPA.

- **Owner-producer:** product gross margin. A specialty fluid or alloy might earn 30–60% if it is differentiated; commodity cathode much less [inference].

The math [inference]. Take a specialty material with $200M a year of sales and a 3% royalty. That is $6M a year to the designer, years after the project, and only if it ships. A lab valued at $3–8B would need dozens of such hits. The same material made by the designer at a 40% gross margin earns $80M. This is why the money is moving toward owner-producers (Orbital) and why CuspAI-type firms are pushing for royalties.

4A.6 The data loop in materials

- **For:** SDLs create negative results and process data that no public set has. Radical says its 300 alloys in 16 weeks compares with 3,493 studied in 20 years [src-20260807-52b690]. Citrine aggregates 70k experiments a month across customers [src-20261022-267188].
- **Against:**
  - Customers often keep the data rights [src-20261016-29997e].
  - Public datasets (OMat24's 110M+ calculations) close the computed-data gap for everyone [src-20130101-5e5543].
  - Each material class needs its own loop: an alloy loop does not help with sorbents.
  - A 2026 hype-versus-reality review of SDLs says that A-Lab's results needed correction [src-20260709-1159ab][src-20240124-513fd9].
- **Verdict [inference]:** the loop is real within one material class and one lab. It is weaker across customers and classes than in factory machining, where every part feeds one quoting model.

4A.7 Right to win (versus incumbents and big tech)

- **Incumbents:** BASF, Dow, Johnson Matthey, Kemira and Albemarle have process know-how, plants and qualification relationships, and they partner rather than build (BASF–Orbital [src-20261022-edad3e]; Kemira–CuspAI [src-20260521-f4b51b]; JM–Kebotix [src-20210803-6788dd]).
- **Big tech:** gives models and data away, so the model alone is no moat.
- **National labs:** Genesis and partners like Sandia are both funder and competitor [src-20260929-dfb65a][src-20261008-452806].
- **Startups win where [inference]:**
  1. They own the physical throughput (Radical, Lila).
  2. They pick a product where the buyer is in a hurry and the incumbent has nothing (PFAS-free coolants, PFAS sorbents, hypersonic alloys, rare-earth-free magnets).
  3. They make it themselves, or lock in a royalty and a supply role.
- **Ranking by fit to SPC's producer thesis [inference]:** Orbital > Radical > Mitra Chem > CuspAI > Periodic > Lila.

4A.8 The bear case, at full weight

1. **No AI-designed material is clearly in volume commercial sale yet** [inference, from sources]. Orbital targets 2027 [src-20260528-375aec]. Kemira's PFAS sorbent and RAI-939 are at pilot or test-article stage [src-20260521-f4b51b][src-20260807-52b690].
2. **The science record is mixed.**
   - A-Lab's claim of 41 new materials was challenged ("no new materials were discovered") [src-20240124-513fd9].
   - For GNoME, the 736 independent syntheses are under 0.2% of the 380k predicted-stable crystals [src-20231129-1dc706].
   - MatterGen is limited to about 20 atoms per unit cell [src-20261022-3e2a9d].
3. **Synthesis and qualification, not discovery, are the bottleneck.** AI speeds up the cheap part.

4. **Buyers have small budgets and refuse to share IP.** R&D software sells in the hundreds of thousands; majors refuse royalties [src-20260913-3ad55e][src-20261016-29997e].
5. **The models are commodities:** open models and Genesis.
6. **Valuations far ahead of revenue:** CuspAI ($450M raised), Periodic ($300M seed), Lila (talks at about $8.5B, reported), none with disclosed material revenue [inference].
7. **Legal and safety issues:** the Royal Society review notes that patent law recognizes only human inventors, and flags safety and cyber risks of autonomous labs [src-20250716-e94853].
8. **Market size:** the lab-automation market is about $8–9B today, perhaps $20–24B later [src-20260709-1159ab] (low). That is small next to manufacturing.

4A.9 The bull case, for balance

1. **Policy pull:** mineral controls (1B.3) and PFAS bans create buyers who must replace a material, not just optimize one.
2. **Defense pull:** hypersonic, propulsion and munitions materials have funded test paths (Radical with AFWERX and RTX) [src-20250825-300a14][src-20250718-d46f24].
3. **Throughput really is up an order of magnitude** (Radical, Lila, CuspAI claims) [src-20260807-52b690][src-20260925-679418][src-20260521-f4b51b].
4. **Data-center demand** gives a fast, rich buyer (Orbital with AWS) [src-20260528-375aec].
5. **Public infrastructure** (Genesis, national labs) lowers the cost of compute and testing for startups [src-20261008-452806].

4A.10 What SPC should do [inference]

- **Treat discovery-only labs as out of scope for producer investments.** Track them as a source of materials for the companies we do back.
- **Pursue owner-producers like Orbital,** and labs moving into production (Radical with a melt and forge partner; Mitra).
- **Diligence questions:**
    1. Which material is in customer qualification, with whom, and what is the spec?
    2. Who makes it at scale, and who owns that margin?
    3. What data rights do you keep?
    4. What do you get in revenue per hit, and how many hits a year?
    5. What happens when GNoME, MatterGen or Genesis make your model free?
- **Watch list:** Orbital’s 2027 GPU qualification; RAI-939 spec-sheet data; Kemira scale-up; Periodic’s first named customer; Mitra’s Michigan plant FID (final investment decision).

5. Company profiles

How to read this. Every company file not marked “not-a-fit”. Each profile says what the company makes, how it is funded, who buys, what it claims and the bear case. “Owner-operator” means it runs its own factory and sells parts. “Hybrid” means it also places machines in others’ plants. Order is by relevance to an SPC Series B-D check [inference].

5.1 Senra Systems (fabrication; owner-operator)

- **What it makes:** wire harnesses and cable assemblies for defense and space, in its own plants (about 95,000 sq ft, two sites) [src-20260701-027c1b].
- **Money:** $65M Series B, July 2026 [src-20260715-68183e].
- **Buyers:** Anduril, L3Harris, Northrop [src-20260128-a16c79]. Growth comes mostly from existing customers and referrals [src-20260701-027c1b].

- **Software:** “Amp”, built in-house. It reads parts lists with AI, pulls live supplier prices, estimates labor and writes work instructions [src-20260701-027c1b].
- **Claims (Senra):** 99% FPY [src-20260701-027c1b]. 1,000 harnesses a month, aiming for 10,000 in 2027 [src-20260715-68183e]. Best at runs of 100-1,000 units, quoted in under 2 weeks; about 190 staff heading to 300 by end-2026 [src-20260701-027c1b]. Its CEO says automation is still early [src-20260715-821445]. Harnesses are about 95% outsourced even at SpaceX [src-20260715-821445].
- **Bear:** every number is company-stated. No customer or expert call covers it; only 10 sources mention it. Harness work is manual, so the edge may be paperwork software, not automation [inference].
- **What this means [inference]:** the best-sized owner-operator for SPC, but it needs real diligence.

5.2 SendCutSend (fabrication; owner-operator)

- **What it makes:** laser-cut sheet metal, CNC parts and finishing, ordered online with an instant quote. Owns all its plants (Reno; Paris, KY; Arlington, TX) [src-20261020-487a39].
- **Money:** $110M at a $1.01B valuation, May 2026, its first outside round [src-20260519-38c7ed]. Series B at $2.1B led by Spark, October 2026, size undisclosed [src-20261020-487a39] (med, one trade write-up).
- **Scale:** 32,000 orders a month, growing about 100% a year [src-20260525-4a12ab]. About $140M a year in revenue (deleted post) [src-20260504-c3ded5] (low). 650 staff [src-20260904-1929b3] versus 169 per Harmonic.
- **Claims (Jim Belosic, CEO):** 48-hour turnaround [src-20260227-e92d45]. Targets 80-90% machine use [src-20260626-541ac8]. A new plant costs about $50M, funded with equipment loans [src-20260519-2d6ceb]. “I love taking VC dollars and putting it directly in the payroll” [src-20261020-487a39].
- **Customer spread (claims):** the largest customer is 0.59% of revenue; he knows a defense firm with 86% from one buyer [src-20260624-3dc6f7]. Only 15-20% of each month’s customers are new, so most orders come from returning, mostly small, buyers [src-20260525-4a12ab]. He says there is “enough demand to at least triple our size”, but loans cannot fund it [src-20260624-3dc6f7]. Mostly commercial work, including 60% of the Fortune 500 [src-20261020-487a39].
- **Bear:** customers “outgrow us” and buy their own machines [src-20251002-6a5afd]. Belosic calls lasers and metal commodities: “I don’t think it’s moat-worthy” [src-20260430-9318cd]. It refuses tight-tolerance work [src-20260525-4a12ab].
- **What this means [inference]:** proof that a software-led factory can be profitable without defense money. Now priced beyond SPC.

5.3 Hadrian (precision parts; hybrid)

- **What it makes:** machined parts in automated CNC factories run on its “Opus” software. Now also runs cells inside Lockheed’s plant [src-20261014-015327].
- **Money:** Series C $260M (equity plus debt), July 2025 [src-20250721-d99a2a]; about $1.6B valuation in January 2026, then $1.37B Series D at $7.87B in August 2026 [src-20260807-b0dc5b]; a $360M bank credit line [src-20260817-c48f28]. About $2.24B raised in total [Harmonic].
- **Plants:** four sites (California, Arizona, Alabama), about 2.85M sq ft. **Claim (Power):** 24 machines inside Lockheed’s Grand Prairie plant plus 24 in Arizona for overflow, live by January 2027 [src-20261015-1a282b]. The Mesa plant cost about $200M for 270,000 sq ft and 350 jobs [src-20250820-cfbf02]. Six factories since 2022, the latest 2.2M sq ft [src-20260921-876080].
- **Share of buyers’ spend:** 2-3% at Boeing [src-20260802-ef6506]; under 10% at Northrop [src-20260802-36d46c]. **Claim (Power):** aerospace-grade trust takes years [src-20260908-65fab6].

- **Claims (Power, podcasts):** more demand than capacity; “every quarter there’s 2 billion more in pipeline”, programs unnamed [src-20260921-876080]. He rejected buying old shops after 12 months of study [src-20260908-65fab6]. He says he was wrong about speed (section 0, point A).
- **What buyers and insiders say (expert calls; med):**
  - *Boeing Defense head of product (customer):* “None of their parts right now are flying … all in demonstration stage.” Today a gap-filler for spot buys of about 100 parts. Scores speed 8, process 9, scale 8 out of 10. “We get very excited when we get a new supplier that gives us a discount of 5%-7%” [src-20260818-9b2d5c]. Also: “we have actually paid probably more” [src-20260818-9b2d5c].
  - *Boeing strategy lead:* brackets and hinges in under a month versus 3-6; a “backup player” and “low-volume shop”; price about equal to PCC or a bit more; automation cuts labor from 100 to 30-50 hours, but machine costs offset it [src-20250712-e5e110].
  - *Northrop unit GM (buyer):* “Cost is secondary.” “Machining the part is just 1/3 of the battle.” Uses Hadrian for small parts and surge work; rates it 8/10 [src-20250707-3b7a46]. A Northrop director adds that incumbents still have better precision and cost, and Hadrian lags on titanium and Inconel [src-20250707-3b7a46].
  - *Ex-Anduril hardware lead (buyer):* Hadrian “struggled to consistently deliver high-quality, complex parts”; a “narrative play”; Anduril sent most CNC prototypes to Protolabs [src-20250709-43486e].
  - *Defense-startup chief of staff (buyer):* uses Atomic Industries more (“turn production in eight days”); Hadrian claims 8-9 days but is “more manual” [src-20250729-a0a78c].
  - *GE program lead:* Hadrian is “too new, too young”; broker markups are “pretty horrific” [src-20250709-0250ae] (low).
  - *Ex-Hadrian head of engineering:* would be “surprised if any one company could capture 1%” of US defense machining; “only have 10 customers”; CAM software vendors are the main threat; buyers cap a supplier at about a third of its revenue [src-20250708-342eaf].
  - *Ex-Hadrian engineer (holds equity):* the first factory’s six machines cost “well north of $10 million”; in years 1-2 Anduril was the only defense buyer [src-20260817-8867f2].
  - *Ex-Xometry VP (peer):* “Hadrian needs 10 factories … Xometry wants 10,000 customers”; revenue “surprisingly small” for the money invested; deals are slow [src-20260808-dc5cbb].
  - *Documentary narrator:* skeptics think Hadrian is “quite defense industry dependent” and overhyped [src-20260926-70087f].
- **What this means [inference]:** the benchmark for the category. At $7.87B it is a reference point, not a target.

5.4 Isembard (precision parts; hybrid franchise)

- **What it makes:** machined parts in owned and franchised factories, all on its “MasonOS” software; US, UK, Germany, France, Ukraine [src-20260310-45bab3].
- **Money:** $9M seed plus $50M Series A led by USV, March 2026; valuation undisclosed [src-20260310-45bab3]. Harmonic estimates about $250M (low).
- **Claims (Isembard):** 40-60% more output and 30% lower operating cost [src-20250929-857f17]. A franchisee goes live in under 90 days. 14 factories, 4 owned and 10 franchised. Now “locking in these long-term contracts … one year, two year, three years” so machine purchases match contracts [src-20260909-b547c7]. Turning down orders [src-20260810-f0371c].
- **Buyers:** a humanoid-robot company used it for two urgent $2.3-6K orders, delivered in 2 days [src-20260621-f96bbd]. An Airbus supply-chain head sees such networks as prototype suppliers [src-20251106-dfddcb].
- **Bear:** Thales Alenia Space’s procurement chief is “skeptical”: he must approve and see each production site, which a franchise hides; not a customer [src-20251110-84b67e]. Output and cost claims are company-only. The CEO spends about half his time recruiting; a quality audit

(AS9100D) found many issues needing a follow-up [src-20260909-b547c7]. BBC: about 100 staff at the 160,000 sq ft London site [src-20261019-202dd7].
- **What this means [inference]:** a cheaper, capital-light version of Hadrian, if primes accept franchised sites.

5.5 Machina Labs (fabrication; hybrid)

- **What it makes:** robots that shape sheet metal without molds (“RoboCraftsman”), plus machining and welding. Runs its own plants and places cells with customers [src-20260204-ce7053].
- **Money:** $124M Series C, February 2026 [src-20260204-ce7053].
- **Buyers:** mostly military repair depots that need old panels whose molds no longer exist [src-20261022-ca4c7a]. About 70% defense; a JASSM missile part in qualification; cleared for defense cybersecurity (CMMC Level 2) [src-20260204-ce7053]. Five Air Force awards worth $7.8M, the largest $3.37M (February 2025), plus $507K to maintain a cell at Robins Air Force Base; the Air Force buys again [src-20250416-317e81]. A Rolls-Royce-side expert says it is for prototypes, “not going to involve in our serial production” [src-20250623-5bc67c] (med).
- **Claims (Ed Mehr, CEO):** up to about 50x faster lead times [src-20261022-ca4c7a]; staff grew from 70 to 240 [src-20260320-1361e2]. A new 200,000 sq ft plant with up to 50 cells making “thousands” of assemblies a year [src-20260204-ce7053]. Gross margin “even if I do poorly … 50%. But more likely close to 70%”, because there are no molds [src-20260430-30ea09].
- **Still in qualification. Claim (Mehr, April 2026):** “one of our programs we are now in qualification phase … about to go to production … couple of years to get to volume” [src-20260430-30ea09]. With Lockheed, “qualifying and going to production for JASSM fuel tanks” [src-20260822-53d33e]. It started with repair parts that took depots “months, sometimes years” [src-20250402-161b61].
- **Bear:** 30 minutes to hours per part versus seconds for stamping [src-20261023-c3b62f]. Mehr himself: in repeat high-volume work “traditional manufacturing is pretty good”, and Machina is “not a good fit” for a million identical parts [src-20260821-1c5a08][src-20251230-2c54a2].
- **What this means [inference]:** real defense demand for repair parts; production at rate is not yet proven.

5.6 Freeform (precision parts; owner-operator)

- **What it makes:** metal 3D-printed parts using AI-controlled multi-laser printers. It sells parts, not printers [src-20241024-7f1c2e].
- **Money:** $67M Series B, February 2026; PitchBook puts it at $179M after the round [src-20260219-2125d7] (med); about $126M raised.
- **Claim (Freeform):** a new platform, “Skyfall”, “scheduled to go live in the first half of 2026”, with 25x capacity and thousands of kg of parts a day [src-20260220-348ad9]. No source confirms it went live.
- **How the loop works:** cameras watch the molten metal pool every microsecond; chips process the images; models adjust the printer live [src-20241024-7f1c2e]. It runs GPU clusters on site [src-20260219-2125d7].
- **Buyers:** hundreds of mission-critical parts a week, customers undisclosed [src-20260219-2125d7]; a fast prototype contract (OTA) from DIU, the Pentagon’s tech-buying unit [src-20260901-6e197d].
- **Bear:** metal 3D printing has the worst failure record in this theme (Velo3D, Markforged; section 7). Freeform’s claims are company-only and Skyfall is unconfirmed.
- **What this means [inference]:** the clearest live feedback loop in precision parts, and small enough for SPC.

5.7 Divergent (precision parts; hybrid)

- **What it makes:** 3D-printed structures plus robotic assembly (“DAPS”). Named defense work: second source for Raytheon’s Tomahawk midbody and CoAspire munitions [src-20260601-976843]. A teaming agreement (not a production order) with L3Harris [src-20261013-eda149]. General Atomics work is a 2023 partnership on small drone frames, not missiles [src-20261022-8629b9].
- **Money:** Series E $290M including $40M of debt, September 2025 [src-20250915-311606].
- **Scale:** Long Beach plant, 430,000 sq ft, 1,000 jobs, online by end-2026, sized for 30,000 airframes a year; aerospace and defense about 80% of work [src-20261023-e02543].
- **Claims (Divergent):** revenue up over 5x [src-20250915-262bfd]; about 30 programs with 15 primes [src-20261014-47f64b]; old Tomahawk casting suppliers get under 20% good parts [src-20260113-c08796]. Some programs about 50% cheaper per unit [src-20260523-b05ded] (unverified). “Over 30 production contracts” in 18 months, unnamed and unvalued; repair parts redesigned in 24-48 hours where casting suppliers quit [src-20251015-e9edbf]. Production car frames for Aston Martin and other brands [src-20250309-b9a3c2].
- **Bear:** asked about a Navy 3D-printing center that “haven’t been able to achieve” 20-40% savings, Czinger called it “an adoption issue” [src-20260113-c08796]. An Anduril engineer called Divergent “not really a scalable thing” (opinion, March 2025) [src-20250623-5bc67c] (low).
- **What this means [inference]:** a car-to-defense pivot that worked; a benchmark at $2.3B.

5.8 Amca (precision parts; buys existing shops)

- **What it does:** bought 8 certified aerospace plants and redesigns parts with its AI platform [src-20260520-af3e6c][src-20261008-149196].
- **Money:** $300M Series B at over $1B (Caffeinated, Lightspeed) [src-20260520-af3e6c].
- **Buyers:** a first Army fixed-price award, value undisclosed. **Claim:** gets redesigned parts approved in under 90 days [src-20261008-149196].
- **What this means [inference]:** the buy-old-shops path Hadrian rejected [src-20261004-9b47f5]. It buys qualification instead of earning it.

5.9 Vulcan Elements (metals supply; owner-operator)

- **What it makes:** rare-earth magnets; a 10-ton pilot in Durham and a 10,000-ton plant planned [src-20251103-ee9b27].
- **Money:** $65M Series A (Altimeter) [src-20261010-8e6ec0]. A $1.4B package: $620M loan from the Pentagon’s OSC, $50M Commerce Department equity, $550M private [src-20251103-ee9b27]. Form D filing shows $430.7M sold [src-20260402-c8e4dc].
- **Buyers:** 7 federal awards worth $5.7M, including an Army magnet contract (IDIQ: an open-ended order vehicle) [src-20260710-6361ea][src-20250501-1885f8]; magnets for the Army drone program [src-20260923-c53c99]. **Claim (CEO Maslin):** the pilot is sold out 12 months ahead; test data feeds its recipe models [src-20250811-e7cb9a].
- **What this means [inference]:** government-backed, with government as the main buyer.

5.10 Mariana Minerals (metals supply; owner-operator)

- **What it does:** builds and runs mines and refineries (Copper One, Lithium One) on its own software [src-20260803-30e6d5].
- **Money:** $310M Series B (Khosla), about $400M including project money; valuation undisclosed [src-20260803-30e6d5]. A $1.5B figure appears only in Harmonic (low).
- **Operations:** about 250 staff, about 20% in software and AI [src-20260623-d1790b]. **Claim:** took over a southeast Utah copper mine and refinery at end-2025 and restarted mining in May 2026, about 50% autonomous, making 99.99% pure copper; “we do not sell software” [src-20260623-

d1790b][src-20260513-bdc044]. **Claim (CEO Caldwell):** 30% lower refining cost and 40-50% lower mining cost [src-20260502-21f16a]; 10 projects in 10 years [src-20260513-dd56eb]. No buyer contracts disclosed. **Claim (co-founder Lozano, Oct 24):** most mine capex comes from project investors separate from VC; East Texas lithium goes to an unnamed battery maker, ramping next year; two projects today; autonomy partly through partner firms [src-20261024-c53370].
- **What this means [inference]:** one of two names with a credible data loop; the check size is above SPC's.

5.11 1872 (fabrication; owner-operator)

- **What it makes:** steel skids, frames and enclosures for energy and utilities, using AI and robots, in Cincinnati [src-20261022-fdbf29].
- **Money:** $15M seed via Ohio's O.H.I.O. Fund [src-20260722-985690].
- **Operations:** 18 staff, about 30,000 sq ft, producing since August 2026 [src-20261016-d61bc1]; welding robots from Path Robotics [src-20260722-3bc2d8].
- **Claims (website, no baseline):** 99% FPY, welding arc on 70% of the time, 85% lower welding cost [src-20261022-fdbf29]. Full autonomy by 2027 [src-20260722-985690].
- **What this means [inference]:** the cheapest way in, but too early to judge.

5.11A Atomic Industries (tooling and molded parts; owner-operator; new in v7.1)

- **What it does, in plain English.** Almost every plastic part (a car bumper clip, a drone shell, a subway seat bracket) is made by squirting molten plastic into a steel mold. The mold is the expensive, slow part: a skilled toolmaker designs where the cooling channels, ejector pins and plastic entry points go, then machines the steel, then runs trial shots and tweaks it, often over many weeks. Atomic uses physics simulation plus machine learning to design that mold, builds it in its own Michigan shop, and then runs the mold in its own presses to sell finished parts [src-20260130-9500f0][src-20261027-b51989].
- **Where it sits.** Detroit area (Warren and Shelby Township, Macomb County, Michigan). Founded 2019 by Aaron Slodov (software, ex-Google per TBPN), Austin Bishop and Lou Young Jr. (a veteran toolmaker, head of manufacturing); Y Combinator W21 [src-20231204-652d42][src-20260128-2b7e8b][src-20250919-2805c7].
- **Plants (company site, updated July 18, 2026).** Warren: 50,000 sq ft, mold building, 8 machine systems (machining, EDM spark-erosion, gun drilling, conformal cooling). Shelby: 100,000 sq ft, 16 injection presses from 55 to 2,000 tons. Markets listed: automotive, rail, industrial, consumer, defense; customers are OEMs and their Tier 1 suppliers [src-20261027-b51989]. It also owns a Velo3D metal printer for 3D-printed tool-steel mold inserts with built-in cooling channels (2023) [src-20231128-ff966f]. Macomb County gave a 50% property-tax cut for 10 years; Atomic plans over $10M of equipment and 30-60 jobs at Shelby [src-20260616-57c7d5].

Business model and where it fits Lilly's two approaches. - It is an **owner-operator**, not a software vendor. Young: "Rather than selling software or molds … vertically integrate that tool building capability into producing parts. Every tool that we can put into production grows our business" [src-20260130-9500f0]. It started as software, then made molds, and now makes parts [src-20250919-2805c7]. - **The pricing idea (company claim):** because its molds are cheap to design and build, it wants to quote a piece price with no separate mold charge. Young's example: "I could quote someone 250 for a piece price, and Company B quotes 250 piece price plus a $300,000 mold" [src-20260130-9500f0]. That turns a one-off tooling sale into multi-year part revenue. - In the theme's layers it is **fabrication / tooling**: a "new producer" in Approach 1 terms, whose edge is AI in the engineering step (mold design and process setup) rather than robots on the floor.

Customers and repeat orders. - **Claim (Slodov, Sept 2025):** “we picked up like our first couple big … part production contracts … it’s just like, you know, I need a widget for five years … we’re kind of in the mid eight figure range for that right now”; target “nine figures” next; about 50 staff [src-20250919-2805c7]. Whether “mid eight figures” is annual revenue or total contract value is not clear from the transcript. - **Named work (company, March 2025):** molds for a drone program and production work for the New York City subway (transit authority) [src-20250327-008034]. Fortune bio: supplies “major OEMs to high growth hardware startups” [src-20260629-d8e640]. No customer is named by a customer. - **Buyer voice (expert call, med):** a defense-startup chief of staff sourcing drone components: “we use a company called Atomic more than we do Hadrian … they have the software design integration mastered … I just cannot believe how fast it moves”; “we can get them designs for a component and they can turn production in eight days” [src-20250729-a0a78c]. This is the only independent buyer on record, and it is about speed, not repeat volume. - **What this means [inference]:** multi-year part programs are exactly the “repeat production order” signal Lilly is testing for, but today they are company-reported, unnamed and unvalued.

Right to win against job shops, toolmakers and China. - **The market it attacks.** US mold builders are small, aging and squeezed. The trade group says Chinese shops sell molds “up to 40% below” US cost, get 90% of the price paid up front (versus 55% of US builders), and a 2018 tariff on Chinese molds was lifted within six months [src-20250101-110ec0]. US shops call themselves “almost a dying industry” short of trained toolmakers [src-20250701-0ecf2d]. Tariffs since 2025 have helped: 54% of 79 surveyed US shops saw or expect reshoring, and one shop’s quote requests rose 25% in a month [src-20250501-39c489]. - **Atomic’s angle (company claims):** design speed is where China wins. Young: “Chinese tool shops can deploy 200 designers simultaneously … the largest tool shop in North America has fewer than 30 mold designers” [src-20260130-9500f0]. Software places cooling lines and ejectors “in seconds instead of days” [src-20260128-2b7e8b]; molds “50% more efficient, built 50% faster and cost 50% less”; cycle times down 20-40% [src-20260130-9500f0]. Slodov: US shops lose bids by slow, margin-gated quoting while China quotes instantly [src-20250327-008034]. - **Against US job shops:** one company owns design, mold build, trials and production, so there is no hand-off between a mold shop and a separate molder [src-20261027-b51989]. Folding the mold into the part price is hard for a capital-thin shop to copy.

Unit economics (what we know). - About $8M spent on the test bed, “more about R&D than direct revenue” [src-20260130-9500f0]; over $10M planned at Shelby [src-20260616-57c7d5]. Roughly 45-50 staff, about 16 of them software engineers [src-20260130-9500f0][src-20250919-2805c7]. - No margin, price or payback data. **[inference]** Bundling the mold into the piece price means Atomic carries the mold cost up front and earns it back only if the program runs its full volume, so its returns depend on long programs and its ability to build molds cheaply.

Data loop. Molds in the test bed carry sensors for plastic flow, ejection force and internal temperature, feeding back into design [src-20260130-9500f0]. Models for cooling-line design are trained on physics-solver output, not on past human designs [src-20260130-9500f0]. Slodov: “we’re the only ones with a labeled dataset because we’re creating it daily in the factory” (claim) [src-20250327-008034]. The site says production results feed back into cycle time and future mold decisions [src-20261027-b51989]. On the scorecard in section 6 this is a medium-strong loop: owned production data, but limited to its own presses.

Team and money (brief). $3.2M pre-seed (2022), $17M seed (Dec 2023, led by Narya with 8090 Industries and Acequia; Toyota, Porsche and Yamaha venture arms), $25M Series A (Sept 2025, led by MaC Venture Capital and DTX Ventures) [src-20220405-b7aac2][src-20231204-652d42][src-20261023-a3bfe7]. Several small SPV filings [src-20250905-f62778]. No SBIR, AFWERX or other government award was found in free sources this run.

Bear case (equal weight). - **Proof is thin.** Every performance number (50/50/50, 20-40% faster cycles, first-shot good parts) is the company's own. The trade editor wrote that success "will be measured not by software capabilities but by results" and listed these as open questions [src-20260130-9500f0]. - **Humans still do the hard part.** Parting lines and die draw (how the mold splits and opens) are not yet automated [src-20260130-9500f0][src-20260128-2b7e8b]. Those are the judgment calls that make complex molds hard. - **Automotive is a slow, protective buyer.** Young himself: automotive is "deeply protective and resistant to change" [src-20260130-9500f0]. Being both moldmaker and molder means competing with customers' existing Tier 1 molders. - **Commodity end-market.** Injection-molded parts are a low-margin, price-shopped business, and Chinese mold prices are up to 40% lower [src-20250101-110ec0]. The tariff tailwind can disappear, as it did in 2018. Tariffs also raise steel and imported press costs [src-20250701-0ecf2d]. - **Capital intensity.** Rolling mold cost into part price ties up cash in steel. With a $25M Series A, a mid-eight-figure book (by its own account) and two plants, Atomic will need more capital or debt to scale. - **Small and early.** About 50 people, one independent buyer quote, no named OEM program. The same speed edge is claimed by Protolabs-style quick-turn molders and by any large molder that buys mold-design software. - **The edge can leak.** Mold-simulation tools (Moldflow-type software) are sold to every shop; if they add AI, Atomic's design advantage narrows to its own data [inference].

Open questions / expert-call questions. 1. To a buyer (Tier 1 or drone OEM): what did you order, how many repeat programs, and did Atomic really skip the separate mold charge? Price versus your normal molder and versus China? 2. To a former Atomic engineer or toolmaker: what share of a mold's design is truly automated today; how many trial loops (T1, T2, T3) does a typical mold still need? 3. Is "mid eight figures" annual revenue or contract value, and how much is parts versus molds? 4. Press utilization at Shelby, and how many molds a month Warren builds. 5. To a US mold-shop owner: does instant AI design change who wins bids, or is price versus China still decisive? - **What this means [inference]:** the cleanest "AI in the engineering step, owner-operator in production" story in plastics, aimed at a real bottleneck (dying US moldmaker base). Worth a call, but the repeat-order and economics evidence is all company-reported so far.

5.12 Nox Metals (metals supply; we passed)

- An automated metal distributor outside Detroit with nesting software [src-20261009-404b9b]. $11.5M seed (Hyperion) [src-20260616-1cf7cb]. About 12 people at one site [src-20260325-5b68db]. Its founder's "controversial belief" is "raw capacity over everything else" [src-20260427-83b102].

5.13 Arda (factory software)

- An AI agent reads design files and writes assembly steps and work instructions [src-20261020-914a64]. $72M seed (Accel, Founders Fund), then $160M Series A at $1.5B; $232M total. **Claim (Arda/Anduril):** work instructions from 10 hours to 15 minutes; complex engineering from 30 hours to about 2.5 [src-20261020-914a64].

5.14 Mind Robotics (factory software)

- Trains robot AI for factory tasks (picking, fastening, plugging in connectors) and sells robots, not parts [src-20261022-eede0b]. Rivian is partner, first customer and shareholder: "a partner of Rivian, but not a spinoff" [src-20261013-cc78c0]. It depends heavily on Rivian and has raised over $1B, with no public product [src-20260515-176e26].

5.15-5.18 Research labs and adjacent names

- **Periodic Labs:** $300M seed, September 2025 [src-20251022-8eb7c0]; reportedly raising much more (med) [src-20260514-5796ab]. Offers custom AI agents to clients' engineers; one unnamed chip client [src-20261022-682e62]. No revenue disclosed.
- **CuspAI:** $450M Series B (Kleiner, NEA) [src-20260720-840ae3]. About 30 industry and 15 lab partners, including Samsung, AMD, Lam and Applied [src-20261022-37a0ea].
- **Radical AI:** $55M led by RTX Ventures, a prime's venture arm [src-20250718-d46f24]; a $1.2M Air Force award [src-20250523-f41dd1].
- **Terrafirma:** $100M Series A, self-driving earthmoving equipment, Austin [src-20260714-976329]; about $500M valuation per Harmonic (low). Adjacent to the thesis.

5.19 Other candidates (one line each)

Fabri: automated casting, $13.5M from RTX and Lockheed venture arms, shipping castings [src-20260617-4dfb96]. Layup: composite parts, $42M Series A [src-20260602-a7b79e]. Hybron: composite shells, $25M seed, contract floor over $100M [src-20260413-abc797]. Rangeview: castings from printed molds, $4.2M seed [src-20260923-3ab808]. Furientis: low-cost interceptor missiles, $25M seed (Benchmark) and a Pentagon OTA [src-20261006-410f77]. Firestorm: drones; moved from small research grants (SBIR) to a repeat-order contract, 19 awards worth $53.8M [src-20251022-629fc0][src-20251219-bd5788]. Re:Build: engineering and manufacturing roll-up, 12 sites [src-20261006-1212f9]. VulcanForms: metal 3D printing plus machining; CEO change, then re-raise [src-20240919-72efcc]. Incumbents are in section 7.

What this means [inference]. Most profiles rest on company claims. Buyer calls exist mainly for Hadrian, and they are mixed.

5.20 More company specifics from all sources

- **Hadrian.** Revenue was $3M in 2023 with a $30M+ target for 2024 (Forbes) [src-20240815-500933]. **Claim (Power, 2025):** "basically 10xed revenue in four quarters"; target about $1B by 2027; "manufacturers in the US are horrifically low margin" [src-20250718-ac643a]. **Claim (Power):** close to 100% of workers "never set foot inside a factory", trained in 30 days; "a 25-year-old kid … running 14 robots" [src-20260610-779f8b]. At Lockheed's plant, "Lockheed Martin employees will operate Hadrian's production cells" (Axios) [src-20261020-09eec1]. The Army's Red River Depot contract runs to March 2027 [src-20260318-472c29]. Hadrian says it does not discuss customers due to "very strict NDAs" [src-20250718-ac643a], which limits checking. All of Hadrian's debt is still corporate; a dedicated plant with a creditworthy buyer would be the first project-finance case [src-20261012-b7af6d].
- **SendCutSend.** More than 300,000 customers and 30M parts shipped, with 1-3 day delivery [src-20261020-9deafa]. Belosic added 450 people in 2026 and is finalizing a first acquisition [src-20261020-1d0bbb]. Named customers include Zipline, Waymo, Anduril, Castelion and Relativity [src-20261020-c541ad]. Ad spend fell from $120-170K a month to about $4K, as word of mouth took over [src-20260525-4a12ab]. Bear: "the software is the easy part … the hard part is everything outside the software".
- **Senra. Claims (CEO Jordan Black):** a harness "can be 25% of the cost of your vehicle"; "800 plus mom-and-pop shops" are going away; the only Department of Labor-certified harness training, 4 weeks versus 2 years; technicians average 48-55 years old; the factory is "only 25% built up"; it "didn't have a sales team until 4 months ago" [src-20260715-821445]. He admits "the dexterity and the models might not be at the caliber we need today" [src-20260715-821445]. A BMW expert agrees harness routing is "beyond the edge" for robots today [src-

20261014-ce5195]. Lockheed consolidated cable harnesses from five factories to one, a sign of the bottleneck [src-20261014-47f64b].

- **Divergent. Claim (Czinger):** the first factory exits “about three airframes per day”; it “haven’t cracked it yet” on exquisite munitions [src-20261014-47f64b]. Printer output rose from 50 grams to 1-2 kg an hour; structures priced “at or below casting”; 500+ products on the same machines [src-20260325-7ba845]. “We never compete as a prime” [src-20261002-b0cee5].
- **Machina.** Its largest client in 2023 was the Air Force; Mehr was “not sure how to compare our pricing” to sheet-metal shops [src-20261023-af2e72]. It won’t start a project “unless the customer is actually committed with some dollars” [src-20260622-7846f9]. Its Form D shows $38.94M sold of $52.61M [src-20260225-5e3f18] (a filing, possibly one tranche).
- **Mariana.** The prior operator shut the Utah mine in 2024 partly for lack of haul-truck drivers; autonomy is bought in from Sandvik and Pronto [src-20260502-21f16a]. Target: 50,000 t of copper a year by 2030 versus about 2,500 t under the prior operator [src-20261011-e2426c]. Headcount rises from the prior peak of ~130 to ~300 despite autonomy, due to more output (**Claim**) [src-20260813-1fe8a2].
- **Vulcan.** Its Benson, NC plant (1.1M sq ft, 10,000 t a year, ~1,000 jobs) is under construction [src-20261020-ca1a28]. Rare-earth oxide feed from Ucore is planned from 2027, so upstream supply is also pre-commercial [src-20260324-61ffc3]. The US set a $110/kg rare-earth price floor for MP and Lynas, a policy demand guarantee [src-20261022-161490].
- **Isembard and Amca.** Isembard hired a commercial chief from McDonald’s/KFC to run its “manufacturing franchise network” [src-20261006-5a64c1]; it has more software engineers than machinists and says 95% of CNC machines are owned by small businesses whose owners are retiring [src-20250619-46e43c]. Amca bought Electrocube, a top-20 Boeing supplier [src-20260212-c61f30], and won an Army Materiel Command contract for engineering, qualification and production (**Claim**) [src-20261008-9941fd].
- **Arda, Mind and Nox. Claim (Arda):** a 2,000-part missile avionics box was planned in two days; Arda is “now used across all of [Anduril’s] product divisions”; its investor says “the price is steep today” [src-20261020-878aa9]. Mind uses Rivian as “a live, high-volume manufacturing environment for model training”; Rivian owns 32.1% [src-20261013-58de15]. Nox: 46 people, 250-300 customers, 75,000 sq ft (**Claim**) [src-20261009-404b9b]; instant quoting is easy with a 50% buffer, the hard part is beating a human estimator [src-20261022-3135b5].
- **New entrants worth knowing.** Helicon (composite drone frames, $16.5M): cycles of 5-15 minutes versus hours; “less than ten customers” (**Claim**) [src-20261020-c4b077]. Westmag (drone motors, a16z seed): China makes “over 30 million more drone motors and robot actuators per year than the U.S.” [src-20260602-66bb0d]. Firestorm’s containerized printers made “1,000 parts on the USS Essex” during RIMPAC (**Claim**) [src-20261019-34ca73]. CircuitHub (circuit boards) says it is profitable and that “90% of high-mix US EMS Assembly COGS is labor” (**Claim**) [src-20260520-09ca24]. Jeevy sends about 90% of volume to partner shops and keeps 10% in-house; SpaceX is a top customer [src-20261014-40926d]. Anduril is building a $3.7B shipyard in Maryland [src-20261017-5be775], so it is both a buyer and a competitor.
- **Failures and warnings, again.** NGP said Daedalus was doubling or tripling revenue months before its insolvency [src-20251203-fc28ea]. A drone founder: “3D printing is most definitely way high on the hype curve and very low on the efficacy curve” [src-20261022-f423ef]. Castelion: dependence on government revenue “is extremely damaging” [src-20251010-d50ea5]. Bright Machines’ Lior Susan: contract manufacturing has “extremely low gross margin” [src-20240508-097e37].

6. Data loop scorecard

The idea. A “data loop” means every part a factory makes teaches its software to make the next part cheaper or better. If true, the leader pulls further ahead over time. This is the core of the “AI-native”

pitch.

Scale: 0 = asserted only; 1 = mechanism described; 2 = partial evidence; 3 = measured improvement over time. **Nobody scores 3.**

Company	Score	How the loop works	Best evidence / what is missing
Freeform	2	Cameras on the molten metal adjust each printed layer live	[src-20241024-7f1c2e][src-20260219-2125d7]. Missing: yield or cost trend
Mariana	2	AI agents retune the refinery every 15 minutes	[src-20260623-d1790b]. Missing: recovery or cost per ton
Hadrian	2	Opus software for workflow, programming and quality checks	30-40 day training [src-20260926-70087f]; 25-75% shorter cycle times at a studied shop and a 50% cut in order-to-first-part time in about two years [src-20261004-9b47f5]. Missing: it relies on outside CAM software [src-20261004-9b47f5]
Radical AI	2	Robot lab tests and learns in a closed loop	8-20 alloys a day [src-20260617-f9d293]. Missing: hit-rate trend
Divergent	2	Design software feeds printer, then assembly	600+ part numbers [src-20250915-311606]. Missing: cost-per-part trend
Senra	1	Amp standardizes inputs, guides technicians, tracks materials and design changes [src-20260715-68183e]	99% FPY claim [src-20260701-027c1b]. Missing: before and after
SendCutSend	1	Instant quoting at volume	32,000 orders a month [src-20260525-4a12ab]. Missing: any learning metric
Isembard	1	MasonOS quoting across franchises	Claim: 40-60% more output [src-20250929-857f17]. Missing: outside proof
Machina	1	Robot forming learns each new shape	Claim: 50x lead time [src-20261022-ca4c7a]. Missing: cycle-time trend
Vulcan	1	Test data feeds recipe models	[src-20250811-e7cb9a]. Missing: any number
Nox	1	Auto-nesting and quote-time estimates	[src-20260325-5b68db]. Missing: scrap rate
Arda	1	Agent improves with host’s design data	[src-20261020-914a64]. Missing: who owns the data
Periodic, CuspAI, Mind	1	Lab or factory as a training ground for AI	[src-20260917-1bcb81][src-20261022-37a0ea][src-20260513-83aa83]. Missing: production evidence
1872	0	The welding AI belongs to Path, not 1872	[src-20260722-3bc2d8]. Missing: everything

What this means [inference]. The loop is real where the process is continuous and physical (molten metal, ore, alloys). It is weakest where a shop makes separate parts to a customer's drawing.

6.1 More on data loops: what the sources say for and against

- **For: the data does not exist unless you make it.** Periodic's founder: published values for one material property "spanned many orders of magnitude", and negative results are unpublished, so own-lab data is needed [src-20260403-ba156a][src-20260106-62dba1]. Meta's open release of 100M+ physics simulations shows simulation data is becoming free, but the same paper says errors remain and "more than just model scaling will be required", which favors real experimental data [src-20250513-fbb4d8]. **Claim (Power):** manufacturing data is "never on the internet"; a blueprint is not enough without machining and inspection data [src-20260908-65fab6].
- **For: concrete loop mechanisms. Claim (SendCutSend):** "after millions and millions of parts … we feed it back into our app … the more jobs that we take in, the smarter we get", for example warning designers about bends; nearly half a million drawings are uploaded a month [src-20260626-541ac8][src-20260624-3dc6f7]. **Claim (Machina):** 150+ sensor channels are recorded every 4 milliseconds [src-20250402-161b61]; a SpaceX part took 25 trials early and now 4-5 on average [src-20260926-70087f]. **Claim (GrayMatter):** 3.6M hours of production runtime recorded [src-20261022-3335bd].
- **Against: the data is siloed and the loop is slow.** Plant data sits in separate layers (machine controllers, MES, ERP), which limits AI (Construct) [src-20250409-8f07e3]. An IMTS observer: "models are largely good enough"; the bottleneck is plant data and adoption [src-20260922-94fcb0]. Physical AI data is "expensive, slow, hard to scale" [src-20260909-524e7c]. Some of Periodic's workflows are "still like 90% human" [src-20261008-83dc1b]. Argonne's academic robot lab publishes its data openly, which weakens the "proprietary data" argument [src-20250217-059784] [inference].
- **Against: trust breaks easily.** AI Robotics' CEO says a pilot fails if "one false detection" makes operators switch the inspector off [src-20261011-5db652]. A VC newsletter warns autonomous plants "keep producing confidently" when wrong, while aerospace change-control rules assume a fixed process [src-20261015-0e1593].
- **Incumbents are using AI too. Claim (Foxconn, NVIDIA event):** 80% faster root-cause analysis, +15% labor productivity, -10% machine failures, +3% first-pass yield [src-20261022-89d710]. **Claim (PepsiCo):** AI digital twins raised a Gatorade plant's throughput 20% in 3 months [src-20261015-0e1593].
- **What this means [inference].** Running the plant does create data others lack, but nobody yet shows cost falling with volume, and incumbents can buy similar tools.

7. Competition and incumbents

How to read this. "Incumbents" are the established, mostly public, companies. Their margins are the bar a startup must beat.

What incumbents earn (gross margin unless noted): - Proto Labs (fast-turn parts): $533.1M revenue in 2025, 44.5% margin [src-20260206-8bb619]; uses AI for pricing [src-20260731-ef3d40]. - Xometry (online marketplace): 34.7% on the marketplace, 39.1% overall, with a $61.7M net loss [src-20260224-a7b149]; partnered with Siemens [src-20260804-7625ed]. - Metal distributors: Reliance 27.9% or 31.6% (Q3 2026) [src-20261021-16bb64]; Ryerson 17.7% (Q2 2026) [src-20260729-407fd7]. - Nucor (steel): 20% versus 14% a year earlier, including a one-off $130M refund worth about 1.3 points [src-20260812-77d6f5]. - Howmet (engine and aerospace parts): $2.55B quarterly revenue; engine unit EBITDA margin 37.7% [src-20260806-9a83f7]; uses AI process control [src-20260301-357ec4]. -

Carpenter (specialty alloys): 32.1%, or 40.4% excluding metal surcharges [src-20261022-d47483]. Rockwell (automation): 49.5% [src-20260804-0e8130].

What expert calls add (claims, med). - PCC (Precision Castparts, a Berkshire-owned supplier) wants accounts of $50M+. Its share of Boeing machining fell from 50% to 30% in 10 years; its parts cost 5-7% more; it is also automating [src-20250712-e5e110]. After a PCC factory fire hit every order from that plant, Boeing will not concentrate supply again [src-20260818-9b2d5c]. - How much Boeing makes itself is disputed: about 40% of parts, with flight-critical work kept in-house [src-20250712-e5e110], versus only 20-30% of the 1.2M parts per airplane [src-20260818-9b2d5c]. One may count spend and the other part count. - Boeing uses more than 10 machining shops and wants 2-3; old suppliers have “extremely high inertia” [src-20260818-9b2d5c]. - Xometry grew after shedding its own machines; Protolabs was held back by its factories; the market stays fragmented for 5 years [src-20260808-dc5cbb].

Incumbents partner rather than build. Lockheed hosts Hadrian [src-20261014-015327], and its venture arm runs a $1B fund [src-20260401-073d24]. RTX Ventures led Radical [src-20250718-d46f24] and backs Fabri [src-20260617-4dfb96]. Siemens bought Altair and Dotmatics [src-20250326-cc1810] [src-20250701-a7fef9]. Lindsay Goldberg is buying up Alro (metal distribution) [src-20260811-27702f].

Failures to learn from. - Markforged (3D printers): valued at $2.1B in 2021, sold to Stratasys for $42.5M in 2026. Velo3D’s shareholders were wiped out but the business recovered (Q1 2026 revenue $13.8M, up 48%). Survivors used several processes, not 3D printing alone [src-20261023-63156a]. - Velo3D refocused on defense after a lender standstill and rescue [src-20261023-9f720f]; its Q1 2026 gross margin was 17.2% versus -73.6% [src-20261023-63156a]. - Bright Machines (failure example only): its $1.6B SPAC deal fell through; it closed Israeli R&D with about 60 layoffs in 2024; it sold only $71.5M of a $145.5M 2022 round [src-20240527-6a4884]. - Daedalus: AI-run CNC factory in Germany, $21M Series A in February 2024, insolvent August 2026 [src-20260801-4532f6]. The closest failed copy of the owner-operator thesis. - VulcanForms: founder CEO replaced, then raised $220M in January 2026 [src-20240919-72efcc][src-20260130-365541]. A pivot, not a failure.

What this means [inference]. The real threat is not Xometry’s software. It is approved suppliers like PCC automating while keeping their approvals, and primes keeping critical work in-house. Survivors found a repeat defense buyer before spending heavily; sellers of equipment did not compound.

7.1 The right to win: versus job shops, contract manufacturers and overseas

The question. Why would a buyer use a new AI-native producer instead of a local job shop, a contract manufacturer (CM, a firm that builds to someone else’s design), or a cheaper overseas supplier?

Arguments for the new producers. - **Old shops are slow to quote and run like consultancies. Claim (Power):** legacy shops “operate like consulting businesses”, reselling $60-an-hour labor at $120 [src-20250509-22b78a]. **Claim (SendCutSend):** job shops need months-long runs to “make their margin back” [src-20260624-3dc6f7]. **Claim (Nox):** a competitor’s quote took about 8 hours per email round versus 10 seconds [src-20261022-3135b5]. - **Buyers like one roof and good paperwork.** The ex-customer FlyX CEO came back to Hadrian for “everything under one roof” and because it is “one of the few that give you the proper documentation”; Xometry’s marketplace was a “big headache” [src-20260806-3a2ec7]. A Raytheon engineer values that Hadrian is 30-45 minutes away, takes 3D model files directly rather than drawings, and showed lower part-to-part variation “than compared to our traditional suppliers” [src-20260823-b3713f]. - **Responsiveness.** An Anduril engineer praises a dedicated project manager and 24-hour responses versus mom-and-pop “radio silence”; in-machine probing cut one lead time by about 40% (7 days to 2-3) [src-20250623-5bc67c]. - **Greenfield beats retrofit. Claim (Power):** after 12 months studying legacy certified shops, they were maybe 30% more efficient after upgrades, so Hadrian built new [src-20260908-65fab6]. “You can’t automate unless

you standardize the hardware”: 40 different machines explode the software work [src-20240622-b8cd8b]. A BMW strategy manager says a new robot-first plant could need 20-40% fewer people, while old plants with spare labor “none of them is really thinking about greenfield” [src-20261014-ce5195] [src-20261021-25a598]. - **Overseas loses on protected and urgent work.** Defense rules and ITAR keep work onshore (section 2.4). **Claim (Isembard):** a new local factory cut lead time from about 10 weeks to under 14 days and “can match on price” for one warehouse customer [src-20260310-cdfd82]. **Claim (VulcanForms CEO):** “we’re winning business back from overseas” [src-20261005-f3f30a].

Arguments against (equal weight). - **Machining is crowded and easy to enter.** A Rolls-Royce engineer: there is “no shortage” of machine shops; it is the easiest entry path [src-20251120-0c271b]. Legacy shops still win big defense work: Bender CCP holds a $40M part of a $944M Navy repair program, paying machinists $35-45 an hour [src-20261018-2b4a22]. - **Incumbents automate too.** Northrop’s new Virginia plant claims about 20% lower recurring cost [src-20261022-1389b7]; L3Harris says AI improves yields at its rocket-motor plant, with deliveries up 60% [src-20261022-869770]; GE invested $600M in three years once demand was certain [src-20261014-47f64b]. FlyX’s CEO thinks an incumbent could build this automation “organically” [src-20260806-3a2ec7]. - **Buyers design for many vendors.** The Anduril engineer wants “a dumb way of making parts” so “four or five different vendors can make the parts”, because “I don’t know how long you will be in business”; he will not switch for “5%-10% cash back” and avoids vendors near 100% capacity [src-20250623-5bc67c]. - **Speed alone is “AI-washing” risk.** Freeform’s CEO: legacy processes “haven’t really fundamentally changed … We can slap iPads on things and epoxy floors”; “ask them exactly how” they use AI [src-20261020-bac9ca]. Interested party, but a sharp test. - **China still wins on cost in open markets. Claim (Power):** US aerospace parts cost “two to three times” China’s, and prototypes “eight to 10 times” [src-20250509-22b78a]. A DoD study: China can deliver a finished forging “for the same cost that a U.S. forge will pay for the raw materials” [src-20220801-c32e19].

What this means [inference]. New producers win on responsiveness, documentation and greenfield design, in markets protected from China. They do not win on price alone, and incumbents are closing the automation gap.

8. Customers and demand

The short version. Buyers pay extra for speed on urgent and prototype parts. Proof of repeat, high-volume orders is thin.

Who buys. Primes (Lockheed, RTX, Northrop, Boeing, L3Harris, General Atomics); new primes (Anduril); military depots and programs (Army, Navy, DIU); and commercial hardware firms (SendCutSend serves 60% of the Fortune 500) [src-20261020-487a39].

What buyers told expert calls (AlphaSense-arranged; med). Grouped by theme.

On price. - Raytheon senior manager: Hadrian quoted about 50% lower, at about a third of the lead time, but no parts had been delivered, and the introduction came via RTX Ventures. Best fit is $300-700 parts, not castings. Suppliers run at 80-90% capacity [src-20250708-2aa3ad]. - Boeing head of product: a 20-25% price gap would make Boeing switch; Hadrian is 2-3x faster and holds 2-3% of precision spend, on prototypes and non-critical parts [src-20260802-ef6506]. - Boeing executive director: at 1,000 parts a traditional shop is cheaper; with full inspection, time is equal; losing Hadrian would barely matter [src-20260908-ed94f0]. - Boeing CTO-org manager: Boeing has paid more so far; a 5-7% discount is exciting; 30-50% would move volume; no certified flying aircraft uses Hadrian parts [src-20260818-9b2d5c]. - Northrop director: incumbents keep a cost edge and will start a price war; lead time is the pain; rates Hadrian 8/10 [src-20250707-3b7a46]. - Ex-Anduril hardware lead: defense buyers do not care much about price; no production volume given [src-20250709-43486e].

On paying for speed. - Northrop process engineer: would pay 20-40% more to avoid a program delay. Hadrian has under 10% of outsourced work, maybe 10-20%, CNC only; replacing it would take months to a year [src-20260802-36d46c]. - FlyX CEO, a former customer: left over cost. A premium of "10%-15% is tops"; 30-40% is "not justifiable". Hadrian is "two times" faster with rework "one in thousands", but aerospace-grade quality is "overkill" for drones. Once qualified, aerospace customers "cannot afford to switch" [src-20260806-3a2ec7]. - Defense-startup chief of staff: Atomic takes 8 days, Hadrian 8-9; big buyers move work in-house after a "honeymoon period" [src-20250729-a0a78c].

On scale and switching. - Raytheon senior mechanical engineer: buys weekly, but spend is "currently in the tens of thousands" during a trial period; "multiple millions" possible later [src-20260823-b3713f]. - Thales Alenia procurement chief: capacity is the pain, and chrome-VI coatings are banned from end-2024. He does not approve second-tier network sites and uses only suppliers with $30-40M revenue; networks fit smaller defense, auto and energy work first [src-20251110-84b67e]. - Ex-Xometry VP: 50-60% of parts arrive with no 3D model; the CEO is in every deal, so sales are feast or famine [src-20260808-dc5cbb].

The contradiction. Raytheon says Hadrian is *cheaper*; Boeing says it is *dearer at volume*. Both can be true if Hadrian prices low on small, urgent jobs [inference].

Qualification: a tax at entry, a moat once paid. Getting approved takes 9-12 months at Raytheon [src-20250708-2aa3ad] and 1-2 years at Northrop [src-20260802-36d46c]. **Claim (Power):** full aerospace trust takes 7-8 years [src-20260908-65fab6]. Airbus is cutting to fewer suppliers and sees networks as prototype shops [src-20251106-dfddcb]. A Raytheon engineer says new suppliers' quality now beats legacy [src-20260823-b3713f]. Amca buys qualification by acquiring shops [src-20260520-af3e6c] [inference].

Repeat orders in federal data. Firestorm is the only producer that climbed the full ladder: small research grants (SBIR), then a Phase III open-ended contract (IDIQ), then repeat task orders: 19 awards, $53.8M [src-20251022-629fc0][src-20251219-bd5788]. Hadrian's Army award was $39.2M obligated of $80M, with one bid [src-20260317-5585be]. The federal record ($79.4M) calls it "DATA RIGHTS AND INTELLECTUAL PROPERTY" [src-20260317-77e798], so it is not plainly a repeat parts order. Raytheon spend is "tens of thousands" so far [src-20260823-b3713f]. Shipbuilder HII pays Path Robotics and GrayMatter per unit of output [src-20260101-164f12]; they are vendors, not producers. Mariana, Arda, 1872 and Nox: no prime awards found.

What this means [inference]. Paid demand today is speed on prototypes and early low-rate production (LRIP). Rate production at scale is not yet proven.

8.1 How buyers qualify suppliers and reorder, step by step

- **The ladder.** An Anduril engineer describes it: first "a PO for six months … If they can do it well, giving another PO for two years" [src-20250623-5bc67c]. Prototypes are bought on lead time, "not price at all"; production is bought on price [src-20250623-5bc67c]. Each change of design, material, source, process or location, or a 2-year gap, means repeating the first-article inspection (FAI) [src-20190801-e81d7b].
- **Repeat orders are real but small so far.** A Raytheon engineer: Hadrian is approved "for all of our different products" and delivers weekly, "meeting our quota", but spend is "in the tens of thousands … on purpose" during a probation; "tens of millions" are possible if classified testing is solved. Testing, not machining, is his biggest bottleneck; mechanical parts get output only "1/3 of the way there" [src-20260823-b3713f].
- **Buyers cap each supplier.** The Anduril engineer keeps a vendor at about 25-30% of its business and wants about 25% spare capacity; SpaceX went from 17 flights in 2020 to 140 in 2024, so vendors had to scale 20x [src-20250623-5bc67c].

- **Churn happens when the work changes.** FlyX left Hadrian because “the cost was going up and also the nature of the projects changed”: most drone work is “less stringent”, so aerospace-grade suppliers are “like you have a Porsche and you are going 20 mi an hour” [src-20260806-3a2ec7]. At 5% cheaper he would pick Hadrian [src-20260806-3a2ec7].
- **What primes say in public.** On an Air Force panel, a prime voice called funding “the elephant in the room”; Lockheed said the government does not “want to buy factories. We want to buy weapons”; one-year max-rate runs lose workers, multiyear deals keep them. Primes want authority to qualify second and third sources [src-20261014-47f64b]. Divergent’s CEO said spare parts work has high part counts and small contracts, and certification cost “will actually ruin the business case” [src-20261014-47f64b].
- **The “field of dreams” problem.** A merchant banker on a defense panel: the Pentagon “cannot actually sign a contract until they have that physical facility built”, but with a contract “financing that facility is a no-brainer” [src-20260325-7ba845]. A Pentagon memo gave contractors 21 days to submit faster munitions plans with “skin in the game” capex (**Claim, Critical Materials Group**) [src-20260902-841664].
- **New primes pull work down the chain.** Anduril says “Hadrian had been involved in design from day one” on a boat program (Contrary, an Anduril investor) [src-20260501-4e5b9a]. Anduril’s COO says of Arda, “We would be behind on our production goals without it” [src-20261020-722aff].
- **Base rates for research-to-production.** Only about 5% of companies graduate from SBIR Phase II to Phase III (production) [src-20240129-b46554]; a CRS study found 49% of 269 Phase II awards generated product revenue [src-20200505-dd1158]. Castelion calls the roughly 3-year gap from research money to a program of record the “valley of death” [src-20251010-d50ea5].
- **Other buyer data points.** Ursa Major won $137M in two Navy contracts, but to develop and qualify, not full-rate production [src-20261014-08000a]. Divergent’s three FY25 Air Force awards totaled about $3.64M, all development-scale [src-20250924-22c5ee]. GM Defense delivered PAC-3 parts 22 days after contract [src-20261019-409403].
- **What this means [inference].** Reorders come in a ladder: probation, small repeat POs, then multi-year deals. Most new producers are still on the lower rungs.

9. Capital and financing

How it works. Venture equity is the most expensive money because investors want large returns. Loans are cheaper but need assets or contracts behind them. So equity usually pays for the first plant, and loans and government money pay for the rest.

Who funded what. - **Hadrian:** about $2.24B of equity [Harmonic]; $1.37B Series D at $7.87B, August 2026 [src-20260807-b0dc5b]; a $360M bank credit line [src-20260817-c48f28]; $900M from the Navy [src-20260320-67ba4c]. A plant costs about $200M for 270,000 sq ft [src-20250820-cfbf02]. **Claim (Power):** about $1B must be spent ahead of contracts, and “equity never funds factory construction” [src-20260921-876080]. - **Divergent:** $230M Series D (Hexagon) [src-20231115-5d0589]; $290M Series E at $2.3B including $40M of debt [src-20250915-311606]; Long Beach plant 400-430,000 sq ft, cost undisclosed [src-20261023-e02543]. - **Isembard:** $59M; undisclosed debt for owned plants; franchisees pay for their own [src-20260310-45bab3][src-20250929-857f17]. - **SendCutSend:** $116M plus the October round at $2.1B [src-20261020-487a39]. Funded by equipment loans: about $50M per new plant [src-20260519-2d6ceb], and its first $750K laser was financed [src-20260227-e92d45]. - **Vulcan:** $65M Series A plus $50M of Commerce equity; a $620M OSC loan and $550M private; a 10,000-ton plant [src-20251103-ee9b27][src-20261010-8e6ec0]. - **Mariana:** about $400M including project money; project finance funds the sites [src-20260803-30e6d5].

Bear. Lowercarbon says hardware companies at Series B often have about $10M revenue and only break-even gross margins [src-20251211-87dc10]. A six-machine first plant cost over $10M [src-

20260817-8867f2]. ABL (asset-based lending, loans against receivables and inventory) is not evidenced for any tracked startup (gap).

What this means [inference]. Equity pays for software, team and plant #1; banks, OSC and project finance pay for plants #2 and on. A company without contracts is stuck funding plants with expensive equity.

9A. Unit economics by layer

The idea. Unit economics means how much a company earns or loses on each part or ton, after direct costs. No startup discloses margins in the repo, so below are incumbent benchmarks and the cost drivers experts named. “(claim)” means one speaker.

- **Metals supply.** Distributors earn 17.7% (Ryerson) to 31.6% (Reliance) [src-20260729-407fd7] [src-20261021-16bb64]; Nucor earned 12% in 2025 [src-20260225-3ea941]. Vulcan’s 10,000-ton plant rests on a $1.4B package [src-20251103-ee9b27]. Metal costs pass through to buyers, and tariffs raise the value of stock on hand [src-20260728-ae7dea]. Margin moves with quote speed, reuse of offcuts and, above all, the price cycle [inference].
- **Fabrication.** SendCutSend is profitable, margin undisclosed [src-20260519-38c7ed]. About $50M per plant, debt-funded [src-20260519-2d6ceb][src-20260227-e92d45]. Material can be 85% of a part’s price (claim) [src-20260611-7b80f0]. Margin moves with machine use, target 80-90% [src-20260626-541ac8].
- **Precision parts.** Proto Labs 44.5%: 49% own factories versus 31% network [src-20260206-8bb619][src-20260206-2b13c7]; job shops 15-25% (thesis.md). A six-machine first plant cost over $10M; top German 5-axis machines cost about $1M each versus $200K for a Doosan (claim) [src-20260817-8867f2]; Mesa about $200M [src-20250820-cfbf02]. Automation cuts labor from 100 to 30-50 hours per part, but after machine costs the net saving is 20-30% at best (claim) [src-20250712-e5e110]. One-time engineering per part (NRE) is $1-5K; casting tooling tens to hundreds of thousands [src-20260611-7b80f0]. CAM programmers earn $130-150K [src-20260817-8867f2]. Machining is only a third of the job; inspection, paperwork and certificates are the rest [src-20250707-3b7a46][src-20260611-7b80f0].
- **Materials R&D.** Custom projects 5-15% margin, platforms 85-90% (claim) [src-20261016-29997e]. A robot lab costs about $20M to build. Buyers pay about $150K per software test, $500K per pilot, $2M per proven candidate and $10-15M a year per lab line (claim) [src-20260909-af3e60]. Contracts run “hundreds of thousands to millions” [src-20260913-3ad55e]. Hit rate and repeat work drive margin; royalties are rejected [inference].
- **Factory software.** Rockwell earns 49.5% [src-20260804-0e8130]. Arda prices by usage [src-20261020-a1e174]. AI Robotics grew revenue about 18x and is profitable without outside money; its key metric is false alarms on live lines [src-20261011-a8b14d].

Power is a minor cost: one plant used 500-600 amps of a 1,200-amp service for 6-8 machines; about 30 CNCs run on 2,000 amps (claim) [src-20260817-8867f2].

What this means [inference]. Owning the factory gives better margins than brokering (49% versus 31% at Proto Labs). But machines are costly, and machining is only a third of the work.

9A.1 More unit-economics inputs, in plain words

- **How a job shop prices.** A vendor guide (low confidence) puts 3-axis CNC time at $35-75 an hour and 5-axis at $75-150; shops aim for 75-85% machine use; markups run 25-40% on

prototypes and 15-25% on production; one case shop netted 4-5% [src-20261023-58b5a8]. Inspection adds $50-150 a part and material markups run 18-35% [src-20261023-6ef991] (low).

- **Margins along the chain. Claim (Mehr):** supply-chain shops run 10-15% margins [src-20250427-5bd04d]. Primes earn about 7-12% on cost-plus contracts [src-20260501-4e5b9a]. A Rolls-Royce engineer: simple parts go “as low as 7%, 8%”, complex low-volume parts need double digits; his former $50-60M-a-year Tier-1 had 450-500 staff [src-20251120-0c271b]. Anduril’s gross margin is 36-38% with a $1.2B operating loss (Contrary, an investor) [src-20260501-4e5b9a]. Protolabs earned 46.4% gross and 12.0% operating margin (non-GAAP) in Q2 2026 [src-20260731-4f4aac]. Howmet’s capex is about 5% of sales [src-20260630-bd78e7].
- **What drives a qualified shop’s cost.** The FlyX CEO: AS9100 costs “hundred thousand, millions of dollars to maintain”; aerospace shops inspect 100% of parts versus sampling (say 5 of 100) at job shops; “the main cost is in the machinery, certification, highly skilled worker” [src-20260806-3a2ec7].
- **Why volume pricing matters.** SendCutSend’s own price list: an aluminum part costs $9.41 at quantity 1 and $3.20 at 100 (-65%) [src-20261022-935cf7]. Belosic: “If I was to run one of those customers at a time, we’d be bankrupt”, which is why nesting many orders on one sheet matters [src-20260219-15615f].
- **Machine and plant costs. Claim (Belosic):** a 12 kW fiber laser costs $1.2-1.3M, “every 3 kW is like 200 grand”; he rejected $4M of conveyors [src-20260626-541ac8]. SendCutSend’s Pennsylvania plant: $63.2M, about 170,500 sq ft, 309 jobs, with a $3M state grant [src-20261020-be0cab]. Anduril’s rocket-motor plant: $75M for up to 6,000 motors a year with 100 staff [src-20260501-4e5b9a]. **Claim (Machina):** a cell pays back “in less than a year”, about 70% of parts are off the shelf, and the DoD estimates one system saves $85M over 25 years by avoiding tooling [src-20250402-161b61]. A stamping die set can cost about $200M but makes thousands of parts a day, so Machina wins only at low volume (LinkedIn commenter) [src-20251009-1f4b2f]. **Claim (Mehr):** a stamping press is used only about 5% of its life [src-20261020-bac9ca].
- **Utilization is the profit lever. Claim (Power):** primes’ machines run about 10% of the time versus 65-80% at Hadrian, giving “$4 of revenue on $1 of capex” [src-20260610-779f8b]. SendCutSend’s CNCs run 90-98%, with 92 standard tools covering 5,000+ unique parts and under 20 programmers handling 100-150 new parts a day (**Claim**) [src-20260525-4a12ab].
- **Robots versus people.** A BMW strategy manager: a humanoid robot’s parts could cost $20-30K, a worker about $60,000 a year, yet “the ROI would still be probably negative” today once charging, IT and supervision are counted; one human may supervise 10 robots after validation [src-20261021-25a598]. Foxconn: a robot pick-and-place “may take … 10 to 15 seconds. But by human, maybe only 2 seconds” [src-20260317-a43440].
- **What this means [inference].** The money is made on machine use and certification, not on robots. A new producer must keep machines busy across many customers to beat 10-15% shop margins.

10. Policy tracker (newest first)

How to read this. Section 1A.4 explains each tool. This is the dated list, in plain words.

Date	Policy	What it does	Source
2026-11-27 (deadline)	China Ga/Ge/Sb US-export ban suspension ends	Ban returns unless extended; germanium already at a record	[src-20261027-f82d55]
2026-11-10 (deadline)	China Oct-2025 rare-earth controls suspension (No. 70) ends	Broad controls return unless extended	[src-20261019-854e22]

Date	Policy	What it does	Source
2026-11-01 (deadline)	OSC fund-finance applications due	$500M-$1B of loans per fund	[src-20260831-4dd3b7]
2026-10-08	Genesis Mission Phase II awards	12 awards worth $159M; 297 first-year projects	[src-20261008-452806]
2026-09-16	FOMC hike	3.75-4.00%	[src-20260916-f0c016]
2026-06-18	OSC rare-earth loans	$725M Energy Fuels, $500M Phoenix Tailings (conditional)	[src-20260618-184e0c]
2026-06	Section 232 adjustment	Further changes to the steel, aluminum and copper tariffs	[src-20260602-b995e2]
2026-01	IRS Notice 2026-11	100% bonus depreciation made permanent	[src-20260114-2075f7]
2026-10-20	Army plan for 1M drones (reported)	Big volume demand for magnets and airframes	[src-20261020-878aa9]
2026-10-20	45X tax credit	Advanced manufacturing production credit: a tax credit per unit made in the US	[src-20261020-7d90fa]
2026-10-19	DPA Title III tally	23 awards, $820.5M since January 2025, mostly rare earths ($405.1M) and rocket motors ($196.4M); none to tracked startups	[src-20261019-68fd3d] (med)
2026-09-23	Army drone magnets	Vulcan chosen to supply	[src-20260923-c53c99]
2026-09-08	OSC	Pentagon office that lends to critical-tech companies	[src-20260908-f6558e]
2026-07-16	IEA tally	$65B of public money committed to minerals	[src-20260716-6a06e4]
2026-04-06	Section 232 metals tariffs	50% / 25% / 10% tiers; grid equipment 15% to 2028	[src-20260402-1b5d6c]
2026-01-01	DIU CSO	Fast Pentagon buying process for commercial tech	[src-20260101-0b051b]
2025-12-18	FY26 defense law (NDAA)	See below	[src-20251218-f0d6ef][src-20251218-6c4228]
2025-12-15	Defense industrial strategy	Uses the Defense Production Act (DPA) to fund US capacity	[src-20251215-98f650]
2025-11-03	OSC loan to Vulcan	$620M	[src-20251103-ee9b27]
2025-08-06	Apple and MP Materials	Apple commits to buy US-made magnets (no dollar figure here)	[src-20250806-a0a34e]
2025-08-01	Section 232 copper	50% on semi-finished copper; refined copper 15% (2027) and 30% (2028) under review	[src-20250805-80f2f4]
2024-12-19	OTA authority	Prototype contracts can roll into production without a new competition	[src-20241219-9f8fcc]

The FY26 defense law in plain words [src-20251218-f0d6ef][src-20251218-6c4228]: - Sec. 804(b) lets the Pentagon sign multi-year orders from FY2026 for SM-6, Tomahawk, AMRAAM, JASSM, LRASM, PAC-3 and cheap mass-produced munitions. - Sec. 867 expands the Industrial Base Fund for castings, forgings and machine tools. It adds grants, OTAs and purchase commitments of up to 10 years, including advance payments. - Sec. 1842 makes each program check within 120 days which critical spare parts advanced manufacturing could make within 24 months, and who pays the setup cost. -

Also: Sec. 225 (robotic munitions automation), Sec. 1652 (Golden Dome cost reports), Sec. 1841 (a civil reserve manufacturing network), Sec. 1847 (a surge report).

Gaps. Golden Dome money to tracked names is unknown. Sec. 1652 only requires reports, though the act's funding tables mention funds "supporting the Golden Dome missile defense system"; the amount is unconfirmed [src-20251218-f0d6ef]. No DPA award went to a tracked startup [src-20261019-68fd3d]. The Vulcan OSC loan is the only federal loan to a tracked name [src-20251103-ee9b27].

What this means [inference]. Policy now pays for demand (multi-year orders, purchase commitments), not just factories. These are the first tools that could turn prototype wins into multi-year orders.

---

11. Companies worth attention

How to read this. "Target" means worth a diligence call now. "Candidate" means worth watching. "Benchmark" means too expensive for SPC but useful for comparison. "White space" means a gap with no strong company yet.

Targets. - **Senra** (fabrication): Series B size, real customers, its own software. Next: founder call; ask for first-pass yield and repeat-order data. - **Freeform** (precision parts): the best-evidenced loop; $179M valuation. Next: customer reference calls (Boeing, DIU). - **Isembard** (precision parts, franchise): a capital-light Hadrian variant; valuation undisclosed; Thales' procurement chief is skeptical [src-20251110-84b67e]. Next: economics per franchise, and how primes would audit franchised sites.

Candidates. - **Fabri:** castings are about 40% of munitions (claim, Power) [src-20260921-876080]; backed by RTX and Lockheed. Next: a second source. - **1872:** cheap entry, energy skids. Next: track to its first repeat order. - **Atomic Industries:** AI-designed molds plus its own presses; claims multi-year part contracts (section 5.11A). Next: a buyer call to confirm repeat programs. - **Machina:** depot demand. Next: verify valuation.

Benchmarks. Hadrian, Divergent, SendCutSend, Mariana and Amca are priced at $1B-$7.9B. (Oct 26 run: no new candidates added; Mariana's project-level financing [claim, src-20261024-c53370] lowers its equity need but doesn't change its tier.) Periodic, CuspAI, Mind and Arda are priced before product; watch for revenue.

White space. - Software for mid-size metal distributors: about 9,400 sites, with the top 50 holding half [src-20251201-4b732d]. We passed on Nox. - Forgings: the Pentagon flags castings and forgings as hard to enter [src-20220215-45c353]; no AI-native forger is in the repo. - Inspection as a service: inspection takes as long at Hadrian as at legacy shops [src-20260908-ed94f0].

What this means [inference]. SPC's entry is a Series B in fabrication or a franchise-style variant, not the expensive leaders.

---

12. Bottom line

Five conclusions. 1. The category is real, but proven demand is narrow. Most buyers value flexibility, scale and total program cost over speed [src-20260921-876080]. Paid demand is speed on prototypes and low-rate work. These startups hold 2-10% of spend at the primes we spoke to [src-20260802-ef6506][src-20260802-36d46c]. 2. The data loop has partial evidence (score 2) only where the process is continuous: Freeform, Mariana, Radical, plus Hadrian's faster training. Nobody shows improvement over time (section 6). 3. Capital falls into three tiers: capital-light owner-operators (SendCutSend,

Senra); capital-heavy owner-operators funded by debt and government (Hadrian, Vulcan, Mariana); and software vendors that need someone else's plant (Arda, Mind) [inference]. 4. Precision parts is priced out at the top: Hadrian $7.87B [src-20260807-b0dc5b], Amca over $1B [src-20260520-af3e6c]. SPC's entry is Series B in fabrication or a hybrid or franchise model [inference]. 5. Policy money lands mostly on metals supply: OSC, tariffs including copper, IEA finance, and DPA awards to rare earths and rocket motors [src-20251103-ee9b27][src-20260402-1b5d6c][src-20250805-80f2f4][src-20261019-68fd3d]. The FY26 defense law adds robotic munitions automation and a fund for castings, forgings and machine tools, but no money has reached tracked startups yet [src-20251218-f0d6ef]. Precision parts gets its pull through prime contracts instead [inference].

Our pick per layer and model [inference]. - Metals supply: Vulcan and Mariana as benchmarks; distributor software as white space. - Fabrication: **Senra** (pick); SendCutSend (benchmark); 1872; Machina (hybrid); Path Robotics (enabler). - Precision parts: **Freeform** (pick); Fabri; **Isembard** (hybrid pick); Hadrian and Divergent (benchmarks). - Materials R&D: Radical and Periodic (own labs); CuspAI (software). - Factory software: Arda and Mind (benchmarks); Siemens and Rockwell (incumbents).

Three risks. 1. At volume, old shops win: at 1,000 parts a traditional shop is cheaper (Boeing) [src-20260908-ed94f0]. 2. Factories before contracts: about $1B needed, per Power [src-20260921-876080]. A munitions slowdown would leave plants idle [inference]. 3. Prices ahead of revenue: SendCutSend's multiple is unknown ("nine digits" of revenue at $2.1B) [src-20261020-487a39]; Periodic and Mind are priced before product.

The strongest bear case. - Boeing buyers report paying more, not less; cost matters only after quality and delivery are proven [src-20260818-9b2d5c][src-20260908-ed94f0]. The 2-10% share is prototype work [src-20260802-ef6506][src-20260802-36d46c]. - The model has failed recently: Daedalus went insolvent [src-20260801-4532f6]; Bright Machines' SPAC fell through [src-20240527-6a4884]; Markforged sold for $42.5M after a $2.1B valuation, and Velo3D's shareholders were wiped out though the business survived [src-20261023-63156a]. - Quality on complex parts is unproven: the ex-Anduril lead says Hadrian struggled [src-20250709-43486e]; Thales will not approve a franchise network [src-20251110-84b67e]. - The AI is thinner than the pitch: Opus relies on outside CAM [src-20261004-9b47f5]; robot learning succeeds about 60% of the time versus 99.9% needed [src-20260904-267293]; A-Lab's 41 new compounds were challenged (not retracted) [src-20240124-513fd9]. - Valuations run ahead: Hadrian $7.87B, Mind $3.4B, Periodic about $7.5B (reported), with no audited revenue. A defense or tariff reversal hits plants built ahead of contracts [src-20260921-876080]. - Most buyers do not value speed, per Hadrian's own CEO [src-20260921-876080]. Labor is under 10% of a new plant's cost, so wage savings do not beat China [src-20260513-bdc044]. - Spare capacity exists: existing shops' spindles cut metal only 34% of the time [src-20250120-419768], so demand can be met without new plants. - Share per customer is capped: SpaceX limits a shop to about a third of its revenue [src-20250708-342eaf]; Boeing will not single-source after the PCC fire [src-20260818-9b2d5c]; trusting a new supplier takes 5-10 years [src-20250712-e5e110]. - Regulators tighten after Boeing's quality failures: "Innovation … is the first thing that gets sacrificed, and Hadrian falls in that innovation category" [src-20260818-9b2d5c]. - Teams churn: 90% of Hadrian's first 10 employees left by year 5 [src-20260817-8867f2]. - AI CAM vendors sell the same automation to every old shop: CloudNC is inside GibbsCAM [src-20261021-9769d1][src-20261009-7cafd0]; ex-Hadrian staff call CAM vendors the main threat [src-20250708-342eaf]. - Some see a debt business, not a venture one: "better suited to debt than VC" [src-20250709-43486e]; "propped up by VC money" (peer view) [src-20260808-dc5cbb].

Bias check on our picks. Senra (10 sources), Freeform (14) and Isembard (13) are among the least-covered names (Hadrian has 76, Machina 42, Arda 33, SendCutSend 31). That avoids picking for press volume, but it means each pick rests mostly on company claims, and Isembard has the one negative buyer call. Treat all three as diligence hypotheses, not conclusions.

What would change our mind. - A prime shows Hadrian or a peer at over 20% of rate-production spend at a lower unit price (bull). - A company publishes scrap, cycle time or quote accuracy improving with volume (the loop reaches 3). - Section 232 tariffs are struck down or rolled back (bear for metals and fabrication). - A tracked owner-operator raises at a lower valuation or stalls a plant (bear).

What this means [inference]. Back capital-light owner-operators where buyers already pay for speed and qualification. Do not pay software prices for job-shop economics until someone shows the loop.

12.1 The bear case in one list (new evidence from all sources)

- **Repeat orders are still tiny.** Hadrian's Raytheon spend is "in the tens of thousands" during probation [src-20260823-b3713f]; Divergent's FY25 Air Force awards were about $3.64M [src-20250924-22c5ee]; Mach's federal awards are R&D-scale [src-20260630-fdc552].
- **Customers churn when work gets cheaper.** FlyX left Hadrian over cost as drone work became "less stringent" [src-20260806-3a2ec7].
- **Primes keep sourcing broad.** Buyers want "four or five different vendors" and cap each at 25-30% of their spend [src-20250623-5bc67c].
- **Robots don't pay yet.** BMW's strategy manager: humanoid ROI "would still be probably negative" [src-20261021-25a598]; BMW has no Figure robots running now [src-20261014-ce5195].
- **Defense demand is lumpy.** One defense company got "90% of revenue from congressional marks" (low confidence) [src-20261022-f423ef]; stop-start budgets are "brake and then the accelerator" [src-20260901-a44eee].
- **Incumbents are booming and investing.** Carpenter's specialty-alloy margin hit 37.7% [src-20261022-679fcc]; Howmet absorbed about 720 extra staff in six months [src-20260630-bd78e7]; Nucor credits "supportive federal trade policies" for record shipments [src-20260727-787ce9].
- **AI tools are for sale to everyone.** CloudNC's AI CAM tool is in 1,000+ shops, including Lockheed's [src-20260908-f98d21].
- **Budget gating (Oct 26).** Carpenter's defense bookings are down because funds haven't reached customers [src-20261022-de5e6c]; 82% of the FY27 munitions request rests on reconciliation [src-20261007-c6f64e]; Reliance is taking share with no AI [src-20261022-1e6872].
- **Commodity risk.** Ganfeng's market value fell more than 75% with lithium prices [src-20250529-3a588b], a warning for Mariana and Vulcan.

Appendix A. Glossary

Term	Definition
A&D	Aerospace and defense
ABL	Asset-based lending: credit secured by receivables and inventory
ACV	Annual contract value
AD/CVD	Antidumping and countervailing duties on unfairly priced imports
AM	Additive manufacturing: 3D printing
AS9100	Aerospace quality management standard; table stakes for flight parts
AS9102	Standard form for a first article inspection report
B2B / B2G	Selling to businesses / to government

Term	Definition
BOM	Bill of materials
CAM	Software turning a 3D model into machine toolpaths
Capex	Capital expenditure: money spent on plants and machines
CHIPS Act	2022 law funding US chip factories ($52.7B)
CMMC	DoD cybersecurity certification for contractors
CNC	Computer numerical control: a computer-driven cutting machine
CRO	Contract research organization: an outside lab hired for experiments
CSO	Commercial Solutions Opening, a fast DoD solicitation
DFARS	DoD procurement rules, incl. specialty-metal sourcing
DIB	Defense industrial base: every company that supplies the Defense Department
DIU	Defense Innovation Unit, which buys commercial tech fast
DoD / DoW	Department of Defense, also called Department of War since 2025
DPA Title III	Defense Production Act authority to fund domestic capacity
EBITDA	Earnings before interest, tax, depreciation and amortization; a rough cash-profit measure
FAI	First article inspection: full check of the first part made
FFP	Firm fixed price contract
Form D	SEC filing a company makes when it sells private shares
FPY	First-pass yield: share passing inspection first time
GM	Gross margin: revenue minus direct cost, as a share of revenue
IDIQ	Indefinite-delivery, indefinite-quantity contract vehicle
IEA	International Energy Agency
IRA / 45X	Inflation Reduction Act (2022); 45X is its per-unit manufacturing tax credit
ITAR	US export control limiting defense work to US persons
Job shop	Small owner-run shop building to a customer’s drawing
LIFO/FIFO	Inventory accounting methods; LIFO lowers margins when prices rise
LPBF	Laser powder bed fusion, a metal 3D printing process
LRIP	Low-rate initial production
MES	Software that tracks and directs shop-floor work
NADCAP	Accreditation for special processes (heat treat, NDT, coatings)
NDAA	National Defense Authorization Act, the yearly defense policy law
NDT	Non-destructive testing
Nesting	Packing parts on sheet or stock to minimize scrap
NRE	Non-recurring engineering: one-time setup cost before production
ODM	Original design manufacturer: builds products others sell under their brand
OSC	DoD Office of Strategic Capital, a lender

Term	Definition
OTA	Other Transaction Agreement, fast non-FAR prototype contract
PPBE	DoD planning, programming, budgeting and execution process
Prime	Top contractor selling whole systems to the government (Lockheed, RTX, Boeing)
RFQ	Request for quote
RL	Reinforcement learning: AI that learns by trial and reward
SBIR	Staged federal R&D grants to small businesses
Section 232	National-security tariff authority (1962 statute)
Service center	Metal distributor that stocks, cuts and ships
SPAC	A shell company that lists a private company on the stock market
TAM	Total addressable market
Tier-1/2/3	Supplier levels below a prime: sub-systems, then parts, then raw inputs
USAspending	Public federal database of contract awards
Utilization	Share of available machine hours actually producing

Appendix B. Gaps and next actions

- Hadrian revenue: two low-confidence figures conflict; get a primary number.
- Startup gross margins: none disclosed; ask Senra, SendCutSend.
- Refining TAM and economics: no free source found.
- Fabrication TAM: none; Census CBP gives counts and payroll only [src-20250626-23f6d9]. Next: 2022 Economic Census receipts by NAICS 3323/3327.
- AI/robotics cost decline over 24 months: no source.
- Golden Dome amounts: the NDAA funding tables reference Golden Dome funds; size and recipients unconfirmed [src-20251218-f0d6ef]. Freeform Skyfall go-live: unconfirmed.
- ABL use by startups: none evidenced.
- Exits (Q14): no comparable acquisition above $100M in repo.

Appendix C. Source coverage (ledger, 2026-10-25)

Per-source ledger: `insights/exports/primer-ledger.csv`; reading notes kept outside the PDF.

Bucket	Read status
Expert calls (all 28 on-thesis)	Read in full, line by line
Podcasts	All 102 read in full (40 earlier, 62 in v3). v5 re-reviewed every reading note (expert calls, podcasts, cited and uncited sources) and added sections 2.8, 5.20, 6.1, 7.1, 8.1, 9A.1 and 12.1. Not citable: 3 files with no transcript (e5f014, da4c3f, 725014). Not cited: one unverified secondary summary (a51ab2) and two duplicates (aafb71 = 8f85ca; dad375 = 876080). Excluded R&D labs (Periodic, CuspAI, Radical) used only for data-loop context
Sources the primer cites (~200)	Read in full, except: the FY26 NDAA (about 517K words) checked against every primer claim plus the manufacturing, munitions, reshoring and tariff sections; the DIU guidebook and the boilerplate parts of 10-Q/10-K filings (e.g. ATI) skimmed

Bucket	Read status
On-thesis sources not cited (~390)	Read in full; 99 turned out to be a title or placeholder only. One 589K-character academic review of self-driving labs not read (general background)
No real text captured	Fast Radius (SEC block page), VulcanForms layoffs, Siemens (menu JSON) and other stubs: claims citing them were removed
Form D / award stubs, noise, duplicates	Data rows checked; category confirmed by keyword scan, not read line by line

Honest limits: the long filings above were not read line by line. Podcast claims are speakers’ words on friendly shows, several sponsored or investor-hosted; they are labeled as claims. Funding and valuation discrepancies were dropped by design.
