COMPANY DEEP-DIVE

Chief Information Officer at DOCS Dermatology Optimistic About AI-Driven Revenue Cycle Management with Amperos

DATE PUBLISHED
14 Jan 2026

INTERVIEW DATE
16 Oct 2025

EXPERT PERSPECTIVE
Customer

ANALYST PERSPECTIVE
Investor-Led (Buy-Side)

PRIMARY COMPANY
AMPEROS HEALTH

OTHER COMPANIES
ADONIS

SMART SUMMARY

Summary

The interview covers the implementation and impact of AI-driven revenue cycle management solutions in a large specialty practice, focusing on the integration, productivity gains, and vendor selection process. The discussion also addresses future expansion plans and the practical considerations of automating claims management workflows.

EXPERT BACKGROUND

- Chief Information Officer at a private equity-backed physician practice management company specializing in dermatology, with prior experience in ophthalmology, optometry, and healthcare entrepreneurship, all focused on technology and operational efficiency in large specialty practices.

EXPERT SENTIMENT

- **The expert is optimistic about the productivity gains and operational efficiencies achieved through the implementation of AI-driven revenue cycle management solutions**, particularly with Amperos.
- **They are cautious about fully automating actions beyond research due to concerns about liability and patient satisfaction**, preferring a phased, attested approach to technology adoption.
- **The expert is positive about the future relationship with Amperos**, expecting the contract to grow as the business expands, and expresses confidence in the company's transparency and customer-centric approach.

TAKEAWAYS

- **Implementation of Amperos has led to a 3X increase in productivity for claims processing, reducing the time** to process 1,000 claims from three weeks to under five days during the pilot phase.
- Amperos primarily automates the research and documentation phase of claims management, handling about 30-35% of total claims, with human staff still responsible for final actions and outlier cases.
- Integration with the in-house practice management system (ModMed) was achieved quickly using RPA, with future plans to explore deeper API integration for greater efficiency.
- The expert evaluated multiple vendors, including Adonis and Thoughtful AI, but selected Amperos due to its payer integration, cost structure, and practical approach to ROI; Adonis is seen as a potential future addition for coding intelligence.
- **The expert anticipates continued expansion of Amperos usage as the business grows, with spend expected to increase proportionally,** and values the vendor's responsiveness and willingness to learn from feedback.

Expert Bio

Chief Information Officer at DOCS Dermatology Clinic. The expert evaluates digital health solutions to improve patient and provider experiences, creates strong IT strategies, and integrates AI-powered tools. The expert enhances engagement and outcomes through design and implementation of the digital health suite. Prior to clinic, the expert was the former Product Strategy and Management Lead, leaving February 2024. The expert curated their plan “E360+” - A Digital Health Suite for Ophthalmology and Optometry.

Interview Transcript

Client 00:00:00

Thank you for taking the time to speak with me today about this revenue cycle management ecosystem for large specialty practices in the United States. Noticed that you had some experience working closely with companies like SuperDial and Amperos and Adonis and others that are building in revenue cycle management.To start off, could you please give us a quick overview of your background and experience in this space?

Expert 00:00:23

In regards to me, I work for a private equity-backed practice management company, physician practice management. We are PPM for dermatology. I play a role of the CIO here. Been in this role for last two years. Before that, I worked for a private equity in the ophthalmology and optometry space. Before that, I had my own company which I exited out to a private equity in the healthcare.

Client 00:00:49

You have an impressive background. Thanks for joining us.

Expert 00:00:53

Yeah, I think I'm blessed. It wasn't planned, it just happened.

Client 00:00:58

That's great. Tell me a bit more about your relationship with those companies, what the stack looked like before you implemented Amperos or SuperDial or Adonis or any of the vendors, and now how it's changed.

Expert 00:01:12

The thing is that, I don't know if you really have heard, the last two to three years has been a big push by any companies to go towards AI to be used in their companies. That whole birth about getting into use cases and all came because of that like, "Hey, what's your roadmap for AI within your company?" I created a roadmap going through my business users trying to understand where we could use AI, which makes some sense. When I say "sense", it's about like, how is it going to benefit a particular business entity? In our case, we have particular verticals like operations, HR, and then revenue cycle was part of it.

When we did our due diligence, we came up with this whole orchestration of entities trying to see, is it clear-cut automation that is required like RPA, or there's something that we could do, more intelligence into it? One of the few things that we found out, we're going to make money if we can get the money to the table faster. Revenue cycle was one of the entity or the verticals that we looked at.

We did the whole mapping or I would say journey of the whole revenue cycle management. We try to find out where are the areas where we can create those efficiencies with respect to productivity and automation. That's when we started looking at all these companies like Amperos, Adonis. We'd also looked at a company called Thoughtful AI, which everyone says that we have done a lot of. We have created multiple X ROI for you.

Another big thing that we were looking at, we have our own EMR/practice management suite that we use across our board. One of the main things that I wanted to make sure is we have our own data warehouse stack or application. One of the main things that I was looking for is for a company which could integrate into a data mart or data and also which could integrate into our practice management/EMR.

That was one of the main things, like you're talking about, how it was looking before. We were just doing a manual process for most of the stuff. We looked at what are the areas that we would like to really create the efficiencies. One was definitely on the front end which is prior auth, prior authorizations, eligibility checks, and all that. The other one which really caught our attention was claims. We were looking at aging of our claims. We are spending a lot of manual hours looking at claims and denials. We were looking at why the denials are happening.

We were spending close to 16-17 FTEs just doing this manual work, is going through like, "Hey, we got rejections, we got denials." They would go through the [eChart] manually, look at what the issues were, then work with the payers, log into their portals or do phone calls or any of that stuff. That was when we were very intrigued by two. Adonis for sure, Adonis was one and other one was Amperos.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Amperos fit the building. I think they're a young company. I know the CEO there. Also, they were recommended by one of my fellow CIOs from another physician practice management. That's when we started working with Amperos. We work with them specifically in a particular use case.

We have our own, I would say, entry criteria for Amperos to work on. We looked at how many of those claims were done manually, what was the throughput for FTE to go through those claims per week, and then try to see how Amperos could help us increase the productivity of FTEs. That was the main use case, was like, how can we do a lot of this manual work and also use intelligence to see if you could use a system that could help us with a lot of this claims and denials use cases?

Client 00:04:59

Looking back, has it increased the productivity of your FTEs? How do you think about the ROI?

Expert 00:05:07

The ROI and all, we're still in a way to calculate it, but when we did our pilot, **we actually increased our productivity by 3X.** One FTE, let's say we are doing 1,000 claims for three weeks. We were able to close those 1,000 claims in a week. That was what our pilot at least got us through. At least the pilot showed that one FTE could do 1,000 claims within or less than a week. I think it was four and a half days compared to what they would spend close to 21 days.

Client 00:05:39

The Amperos agent, my understanding is it does a lot of the research but doesn't necessarily take the action. I think you still have your team taking the action. What does the Amperos agent do and what does your team do?

Expert 00:05:54

You're right in that. One of the things that I think that AI agent helps us to at least get to those claims that can be automated, they have an AI agent which goes through the stack, through our database. We have not given all our use cases. I'm giving a small example. I can't go very deep into it because that's an IP for us. We talked about for a certain particular dollar value, aging of maybe more than, let us say about 30 days with some particular payers. Amperos doesn't they don't do for all the payers because they're not equipped to. We looked at all those.

One of the major things why we used Amperos is like the major payers that we use, I think Amperos, they're able to connect to those payers either through their phone calls, like agentic AI that they use, agentic AI or they also were able to use. It's a combination of both. That's what they do.

Again, you're absolutely right. What they help us do is ensure that we have the right, I would say, documentation that is required for us to process. The way it puts it is, let us say claim is denied for such, such reasons, like three, four reasons. Amperos helps us with all the documentation with it and puts it back into a practice RCM suite of our practice management.

We attest to a level, but we are in a comfort zone that whenever Amperos puts it in back into our systems, they do a read and write into our system. They just go and just click a button to process it right now. Before, they would do all the other stuff of talking to the payer, logging in, looking at the documentation, anything missing. All those stuff are done by Amperos. It makes it ready for our claims department to just go and click a button saying that we have enough information to process this.

Client 00:07:46

That's helpful. How long have you had Amperos live?

Expert 00:07:51

We are one month into live. We did about close to two months of pilot with them. We're about three months.

Client 00:07:58

Got it. It seems like Amperos is doing some of the research work. Your team is taking the actions and yet you still found 3X productivity. Is that because most of the work is in the research and less on the action?

Expert 00:08:12

Exactly.

Client 00:08:13

Can you speak to the dynamic between the two?

Expert 00:08:16

I think most of your work, 70% of your work is research. Action is the last bit. You need to understand why a particular claim didn't go through. You have to do all the research. That's mostly done by Amperos first. Again, the thing is that, I'm going to be very cognizant of one fact, they're not doing 100% of everything. We have set ourselves a containment of saying that maybe they only do for 70% of payers. Within the 70% of the payers they're okay with, not every claim that we put through goes through it.

We put ourselves saying that if they can contain to 40%-45% of these claims, that's good enough for us. They're not doing 100% of all our claims. Let us say we're doing 10,000 claims a week. They're able to hit about close to 4,500 of those claims. Again, there is a 70% of which go through them. Out of the 4,000, 5,000 claims we say that Amperos-ready claims, **Amperos is successfully** able to process about 3,000 of them. In whole thing, we're talking about 30%, 35% of the claims are processed from Amperos which are ready for our FTEs.

Client 00:09:30

Prior to that when **you built in-house tooling around improving claim efficiency**, did you get anything close to that? How has that 30%-35% number increased presumably over time since you implemented Amperos?

Expert 00:09:45

The thing is that those 35% of the claims that are now processed through Amperos, right now **it's just click of a burden for us**. We have taken about, out of 10,000, 3,500 to them which our human agents are not wasting any of the time on research. Also, they're just clicking on that. Before that, automation was really very, very less. We were just using RPA. You're using UiPath just to log in and fetch the data that we have to go and do research on.

Now Amperos does that. It reads all those claims for us and then does an action item on it. I think through RPA, they write it back into our practice management system, make it human-ready. That's what it is. I think that was missing. **We were able to extract data or fetch the data from where the problematic claims** were, but we were never able to take an action. That action, research, whatever it is, is being done by Amperos.

Client 00:10:44

How confident are you in Amperos's research? Does your team spend time reviewing the work that Amperos did?

Expert 00:10:53

I think any AI project, to be frank, I didn't get the name, but any AI project, at the level the AI products are, have to be 100% attested by humans in the pilot phase. That was the whole idea why we spent about close to two months in pilot, is just to ensure that the quality of work that Amperos was giving us back, we were confident. That's what we did for almost two months. We corrected all the issues. Again, end of the day, it's AI, it's technology. There's always still binary. When we got up a confidence of at least 90%, that's when we said, "Yeah, we're good."

Client 00:11:32

There used to be, you mentioned, about 15-20 people working on claims. Has that number now dropped to another number? Where do those people go?

Expert 00:11:43

That's the whole point. This is a twofold approach that we took as a team, me and also the vice president of our RCM and all. One is ensuring that we create efficiencies with our present workforce and also aiming to see we don't hire more people when we start expanding our business. It was twofold.

Client 00:12:02

Maybe just a couple of last questions to round out this discussion on ROI, how much, just ballpark figures, are you paying for Amperos today? I know you haven't done the exact calculation for ROI, but do you expect it to be a 2X ROI, a 3X ROI in terms of spend?

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Expert 00:12:21

The thing is that, that is where we're trying to call, because Amperos comes up with their own ROI study. They come up with saying that "Hey, you know what, we save these many man hours for you, which is equivalent to," like that accounts to about 30% FTE cost that we have, saying that, "Hey, **that's the reduction** that we are doing." We are also trying to see from our side that it's not just reduction of time, we also need to see that the denials and the claims that didn't get through, we are able to get it back from the payer.

That particular cycle is when we as a team are saying, "Hey, that is when the success criteria is." It's just not automation that makes us feel successful. I think we feel successful is that whatever Amperos went through with this whole research and all, when we press that particular button and the payers accepted it. We are studying that right now very intensively for the last two to three weeks to understand that.

The only thing that right now with the amount of three months, whatever we spend, we only have seen is what I just talked about, is like the 1,000 claims that we took three weeks, we were able to get it done within four, four and a half days. That's the only productivity that we have seen. Now that has to account back into how to cut my FTE and all. If I even reach 40%-50%, I'm good.

Client 00:13:42

Okay. Maybe you can talk about integration. I know you mentioned you had your own EHR. What did the integration look like? How long did it take to get up and running?

Expert 00:13:56

The thing is that there are two paths they take. They integrate through your APIs or APIs that are available, or they also try to fetch the data from a data mart. The last one which we took the route was they were doing an RPA route. I think it didn't take more than two to three weeks for us to stand it up. It was pretty easy. The only thing that they right now are doing is this. We used to give them a whole extraction file saying that "Hey, these are all the claims that you need to work on," and they would read that particular file and use an RPA and log into a system and do it.

That simple thing, that was done within a week by then, because the system that we were using, they had already used the system in the past. When we started automating that we stopped giving them any extractions, like an Excel sheet or something, where they had to log into a system, extract the data, what they felt was Amperos-ready, and then write it back into our systems using RPA and little bit of API integration, I think that took about three and a half weeks. The way is that we also wanted to understand how Amperos helps. We took a phase approach where we did semi-manual with their automation for first few weeks.

Once we felt that Amperos was able to do the job of at least getting the research done, then we started adding the endpoint integration. That's why the first two months when I talked about pilot, we started our first few weeks doing a lot of manual stuff, giving data to Amperos, and Amperos would process it with the peers. After two or three weeks when we had discerned that the quality of work is good, then they started a week off reading the data. I think they spent on the two to two and a half weeks to write the data back into the system.

Client 00:15:39

Were there **any frictions in that process**, in the integration process or the onboarding process?

Expert 00:15:46

Not noteworthy. In any technical project, there will be **some frictions**, but not that where I would say, "Hey, you know what, let's step back and think about it." I think they knew what they were doing.

Client 00:15:58

Got it. You mentioned the practice management software is in-house. You're not using a third-party software.

Expert 00:16:06

No, the practice management, EMR is the same product.

Client 00:16:11

What product is this?

Expert 00:16:13

It's Modernizing Medicine, ModMed.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:16:17

Got it. They had pre-built integrations into ModMed for you.

Expert 00:16:21

At least that's what they claim. We have not really used a lot of API integration in this process the way I wanted. With the simple RPA stuff itself, they were able to get into ModMed. We wanted to get to market fast on this so we were okay with it, but in the future, we're also thinking how we can tightly integrate with the APIs and all. We have not started any API integration with them. They are capable of it if ModMed gives those API server. ModMed as in, I don't know if you know about ModMed, but they're very closed solution.

Client 00:16:56

What does the integration look like today? Is it a daily dump?

Expert 00:17:02

No, we don't do it. Right now they do RPA, they go in and extract the data themselves. They go in, they look at the queues that are out there, they read the data, extract it, create their own extraction. They have an extraction tool to extract it, and then they process it and again write it back. It's now real runtime, but we only go to the claims every 24 hours. We have a lag of 24 hours, the claims when they were put in.

Client 00:17:30

Helpful. Is there any system that they're not integrated with that you feel like would be helpful context as they're doing this research work? Is it limited in the context that it has?

Expert 00:17:42

It's about the number of payers. I think that was one of the questions. Matter of fact, we were just talking two days back, their standard is they want to hit at least 70% of payers. They're almost there with us. One of the things that I think anyone needs to research is, out of the 70% payers they say they can work with, we looked at what are those big five payers that we use and we found they integrated with them.

I think it's UMR or someone that they don't have that good integration with, but I think they have integration with a lot of payers. I think it's all about payer integration. **They have a very good payer mix integration, solid in place**. One of the things why we even selected it is because of they have very good mix of integration into this full payer community.

Client 00:18:32

That's helpful. On this point of discussions you've been having with them about ways to expand their product or improve their product, what's the natural next step for their product? Where would you like to see them expand?

Expert 00:18:47

I think the seamless integration into API would be one and also the contentment. Right now we're only able to process about 35%, 40%. Maybe increase that. Also, on the research and documentation side, I think they have a lot of scope of increasing that, specifically using more NLP or any of that type of a thing. They claim they have a lot of that, but I would say it should be pretty seamless how a human does right now from the claims perspective, trying to take this runtime decisions.

Some of the claims, Amperos cannot do it because it may have a little bit of a more payer mix or some of the outliers. I think **they are growing**. I think every time they have one failure, at least they told us they have a knowledge base they create to improvise their model. **They are doing pretty good** for what they are. I think if they can increase the number of payer mix and also increase the intelligence from the perspective of how tactfully they can take those runtime decisions for the outlier use cases, that's where they will become better.

Client 00:19:53

That's helpful. When you talk about the outlier use cases, are there certain types of complex analysis with the current payer mix that they can't do and then your team has to go in and spend more time fixing?

Expert 00:20:07

We kept it very simple. If Amperos doesn't do it, the status in our stacks remains the same. The team was doing it with Amperos or without Amperos. There is nothing out there like if they're not able to process, they don't even touch anything. There's no change in the state of how

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

the claim is when Amperos went in and they couldn't do that. In a way, we are safe in that way that there's no double work or anything. These type of claims are done by our team. I don't see any issue in that perspective.

Now outliers, again, within the payers, you have subdivisions of the way it can be like party, party, those sort of things. We feel that sometimes it's not intelligent enough to differentiate the payers depending on how they have been documented within our system. That is one. Again, I'm not too much on the revenue cycle, but what I also heard is if some extra documentation or anything of that is required, they don't want to dig deeper into it. They just stop it because they feel that humans can do better.

Client 00:21:13

Do you see Amperos moving further downstream beyond research, into actually taking the action, submitting the denial automations?

Expert 00:21:21

The thing is that, can they do it? Even now they can do it, but again, it's about the type of liability they want to pick up. If any of the wrong claims go in, who takes a liability? I don't know if Amperos would like to take that liability on them. The thing is that one of the biggest issue, if you see from the perspective of patient dissatisfaction, is that they go to claims and you start sending them all these notices. If we have any wrongful actions like that, **that is a patient lost for us**. I don't think I would like to do it myself as a decision maker of taking technology that I would let them do the final action at all.

Client 00:22:01

Got it. Even if Amperos built a feature to automate taking up some of the actions, you may not enable that or purchase that.

Expert 00:22:09

I wouldn't for now. I would say these are all new technologies and all. One of the things at least in our company we always have, we're trying to mature technology, we say baking period within our own company. That's why we do a lot of attestation to get to the confidence level where we want to be. I don't know, maybe in a year or so, we feel so confident that most of the claims that these guys actioned on were so simple that we could pass through. Maybe we can start creating some subset use cases saying that "For this period, this type of use case, Amperos, just go ahead," but again, we are not there yet.

Client 00:22:45

Makes sense. As we talk about how likely your business is to expand your spend and usage with them, do you anticipate that your current spend will increase or double over the next year or triple or mostly stay consistent?

Expert 00:22:59

You're talking about as a business **we're going to grow**?

Client 00:23:03

The spend with Amperos, the contract with Amperos.

Expert 00:23:07

I think **the spend on Amperos is going to be very directly proportional to the expansion of our business** and the number of claims we have. Amperos, if they're going to do what they are supposed to be doing and if they're still successful within next few quarters, they are here to stay with us and expand. We are thinking, do we price our size? That doesn't mean that Amperos, we will be doubling our investment to that. The idea is that we have already done some substantial investments that stay, and also **we can pick up more of our claims through them with the present bandwidth** that was given to us and then expand on that. They will be there part of us.

Client 00:23:44

That's helpful. Do you think it's more likely that the contract grows over next year or shrinks?

Expert 00:23:52

Definitely it's going to grow. It won't shrink for sure. I think most of these AI guys have put their contracts to have a minimal transactions. We have to hit those minimal transactions and then grow with that. There's no way they're going to shrink. The only way it's going to happen is either they stay with us and they'll be successful with us, or they grow with us, or they're going to go out if we have issues.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:24:16
That's helpful. From all your interactions with them, is Amperos a company that you would work for or work with, or what's your general sentiment? Is it a company you'd want to be a part of?

Expert 00:24:28
The team that I've interacted with, the CEO, Michal, and all these guys, **they have this burn in them**, I think, to make their customers successful. I like that. I would say the DNA that they have in their company, I think that's really helpful. We went with like three, four companies that we wanted to be part of this whole RCM thing. This is the only company which we felt like they're walking the talk, which really helps.

They're very transparent of what they were going to do, but there's a sales pitch always like, "I'm going to give you 6X returns, 5X returns and all." When we said, "Don't sell us that," they knew it and they said, "Hey, let's work with you, understand what the ROIs are." They had their own standards that they told, 'Hey, **we got to hit these**," which helped us within our own template to create what this project is going to be successful from the perspective of the KPIs that we have set. That's one thing that I really like. They didn't push us too much, they didn't oversell. Would I invest into this particular space, specifically in the hot space? Yeah, I would invest into them.

Client 00:25:34
That's helpful. I know you mentioned Adonis earlier, maybe SuperDial. Who else did you look at and evaluate? Maybe can **you talk a little bit about nuance with some of the products**?

Expert 00:25:48
Adonis, we did it. Adonis, they were more into I think reading the data then using some intelligence and giving the data back to us. There were no actionable items on Adonis. At least that's what I understood when we're talking to them. The other one that said we can do everything was Thoughtful AI. I think that was what they were called. It was Thoughtful AI. I think that's what it was called.

I don't know, man. Those guys kept on saying they can do everything through the whole revenue cycle management life cycle. I always saw their demos which were in YouTube. Never saw a live demo. They were very confidential about how they want to do. **The upfront costs were very, very high**. That's why we didn't go with them because of the ROI wasn't even making sense.

There were other people who said, "Oh, we're going to give you 10X, 15X returns," which again, it just turns you off whenever someone says it. You don't even understand my business and you're already saying you want to give me a 10X return. That was a big red alert for me saying that.

Again, we were very specific about the type of use cases that we wanted to really do and which we thought **we're going to be successful** with. I think that's where Thoughtful AI came into picture. There's **a huge gap**, I don't know, if you know someone, please do tell me, is on the eligibility and prior authorization side. That's a big, big place. End of the day, I would like to know what I need to collect from a patient at the point of service than after the patient has left.

That particular use case is still pretty wide open, which I thought Thoughtful AI said they're going to do it, but again, we could never get them through. There's another company. I'm forgetting that name. They were pretty promising. Let me check my notes. I can check my notes and tell you. They're pretty promising.

Client 00:27:49
My colleague just dropped off, but I will ask her about the eligibility and prior auth.

Expert 00:27:55
Definitely. I think that's one space. There's no one in the market who's doing that.

Client 00:28:03
For Adonis, did you guys implement the product, or was it mostly just visibility and that's why it didn't do much of the research?

Expert 00:28:10
Adonis, I think the use cases that we were looking at and what Adonis was trying to do for us, **it wasn't really hitting the mark**. Again, there was a lot of R&D in that space. One of the things that I was looking for is has anyone worked with. Amperos was one which said they

had worked. Adonis, I really like that whole group. It's just that the use cases that we wanted was not something Adonis was doing right now.

Client 00:28:37
That's helpful. Is that a company you could imagine implementing over time?

Expert 00:28:43
I would love to. I would like to get Adonis because they actually give you a lot of intelligence on how your charges were done. It goes down to the core CPT codes, and depending on the payer, would this claim go through or not? They do a lot of intelligence on the claims that are out there. For example, whatever the charges are done, once we finalize a case, Adonis can go in every day and say, "Hey, these particular charges, I think, definitely are going to go for denials. These are the ones which you have no issues about." That intelligence helps.

You can send out information back to the provider saying, can you make those changes to your documentation or anything to ensure that the payer will pay us if they're upcoding or downcoding? I think that particular thing which Adonis, it was creating more intelligence. They'll give you access to the portal to use those intelligence and send it back.

The thing is that our team was doing pretty well from coding perspective. We never had that issue. Where Adonis was getting into creating this coding efficiencies and doing that intelligence was not really a requirement for us right now, but do I want to use it? Yes, definitely. As we grow, I think that will also become a big part, is having that intelligence with you to understand how we are documenting your charges and everything. That's going to be playing a very important role so that **we cut down the claims denial process and all that**.

Client 00:30:12
Awesome. Was there anything else we haven't covered with regards to space broadly and Amperos specifically?

Expert 00:30:20
I'm waiting for you to ask me any specific questions, but not that I am thinking of right now, because we're also in the early stages of implementing Amperos. I think the barrier of their entry into us and the costing, I would say, it is what attracted us. Not that I can think of, but I think definitely we are giving a lot of feedback to them which will help them grow too. It's always good to see what's happening. They're learning a lot about the failures. They're creating a good knowledge base. That's helping us with some new ideas and all, but again, we're too early into it.

Client 00:30:56
You're spending maybe low-six figures on Amperos?

Expert 00:31:00
Yep.

Client 00:31:02
Okay. There is about low-six figures on ROI.

Expert 00:31:06
Definitely. That's why I'm saying we were thinking 60%, 65%. That's why I said **50% is also a good win for us**.

Client 00:31:16
You're saying 50% of the total spend, how much you spend on the solution.

Expert 00:31:21
Yeah.

Client 00:31:22
Perfect. Thank you for your time. This was very helpful.
