SMART SUMMARY

Summary

The interview covers the expert's experience implementing Duvo's AI-first automation platform at a large e-grocery retailer, including evaluation against other solutions, use cases, strengths, weaknesses, and integration challenges. Discussion also addresses ROI, user adoption, and the platform's evolution and future potential.

EXPERT BACKGROUND

- Director of Business Process and Excellence at a leading Central European e-grocery retailer, responsible for product teams, innovation in commercial supply chain and operations, and implementation of automation and software solutions across five countries.

EXPERT SENTIMENT

- Views Duvo as a highly customer-centric and rapidly evolving AI-first automation platform, with **significant advantages over traditional RPA tools for non-deterministic tasks**.
- Believes Duvo delivers substantial business value, especially in enabling new processes and efficiencies, but notes the platform is not yet fully enterprise-ready in terms of transparency and incident management.
- Expresses **cautious optimism about Duvo's future capabilities**, but highlights the need for further development in enterprise-level features and integration for broader adoption.

TAKEAWAYS

- The expert's company is a major customer of Duvo, using it to automate hundreds of workflows, primarily through business domain 'power users' rather than IT staff.
- Duvo is preferred for automating non-deterministic, AI-driven processes, while deterministic tasks are still handled by other tools like n8n; UiPath usage has been largely phased out.
- **Key strengths of Duvo** include its user-friendly process mapping, intuitive UI for agent creation, and the ability to chain agents for complex workflows.
- **Current weaknesses** are lack of enterprise-level transparency, incomplete incident reporting integration, and limited support for deterministic automation flows.
- ROI from Duvo is driven more by enabling new business processes and intelligence (e.g., purchase price evaluation) than by direct FTE savings, with annual costs in the high six to low seven digits.

Expert Bio

Director Of Internal Systems & Process Excellence at Rohlik The expert can speak to being a current customer of UiPath and Duvo.ai, having involved evaluation experience with the latter. They also compared Duvo.ai against n8n, selecting it for its user intelligence. Vice President of Product: Internal Solutions and Process Excellence at Rohlik Group. Reporting to the Chief Executive Officer or Board Level,

the expert is responsible for leading product teams that deliver solutions serving colleagues across departments, from warehouses and last mile through to supply and commercial. They define the strategy for the development and delivery of core internal systems across the multinational business, ensuring continuously derived value in collaboration with the process excellence team to build intelligent, scalable, and integrated solutions in e-grocery. Prior to Vice President of Product: Internal Solutions and Process Excellence at Rohlik Group, the expert was the Head of Product: Operations Systems, Head of Operational Excellence at Rohlik Group, leaving in August 2025. Reporting to the executive leadership team, the expert was responsible for driving operational excellence, standardisation, lean culture, and effective implementations alongside the product team to foster both continuous improvement and disruptive changes in operations. Prior to Rohlik Group, the expert was the Head of Product: Operations Systems at Rohlik Group, leaving in February 2024. Reporting to the board level and senior stakeholders, the expert was responsible for driving the evolution of operational processes for the multinational business to optimise planning, warehouses, and last-mile execution. They created and executed robust strategies and roadmaps for operational innovations, prioritised cost-benefit ratios, and led cross-functional innovation teams comprising product owners and developers. Prior to Rohlik Group, the expert was the Program Manager, Operations at Rohlik Group, leaving in April 2023. The expert can speak to e-grocery operational innovations, internal system strategies, warehouse and last-mile execution optimisation, lean culture implementation, and managing cross-functional product development teams.

Interview Transcript

Client 00:00:00

Thanks for speaking with us. We're looking into Duvo, which we understand you're a customer of. I think we're just going to want to understand the company a bit better, as well as any evaluation you've done, strengths, weaknesses, etc. Before we dive in, it would be great if you'd just give us a brief background on yourself and the company that you work for.

Expert 00:00:22

Yes. I'm working for a company, Rohlik Group. That's an e-commerce grocery player in Central Europe. We are in five countries, Germany, Czech Republic, Hungary, Romania, and Austria. I'm responsible for product teams in the retail part. I'm managing innovations for commercial supply chain and operations, everything from automation in warehouses to software changes, and also implementation of agents.

Client 00:00:50

Got it. Could you give me a sense of the scale of the actual company in terms of revenue, or employees, or anything of the sort?

Expert 00:00:58

Yearly revenue is above €1 billion. What other parameters are you interested in?

Client 00:01:05

Maybe just number of employees or anything of the sort.

Expert 00:01:09

Employees, we are 2,500+ roughly across five countries. This revenue, low ten figures last year.

Client 00:01:18

Okay. That's very helpful. Thank you. With regards to Duvo itself, can you help us understand the relationship between Duvo and Rohlik Group?

Expert 00:01:30

We collaborate. We have signed contract. We started to collaborate in a pilot phase last October. Currently, we have a collaboration in production. We sealed the contract, and we are actively building and using agents on the platform.

Client 00:01:48

Got it. It's like a design partnership. Would that be the right way to look at it? I'm asking whether the partnership is one in which you're co-developing the product and maybe have preferential terms as a result.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Expert 00:02:02

No. Practically, Duvo is very reactive. They are really customer-centric. If you have requirements which you need to have on the platform, they are fast to ship it. **We are one of the biggest customers**. They have some preference treatment for us, but it's not contractual.

Client 00:02:22

Got it. The founder of Rohlik Group is the same founder as Duvo. Is that correct?

Expert 00:02:30

Yes.

Client 00:02:31

Could you maybe just elaborate a bit more on that, how Duvo got started, whether that was within the organization, or a bit more about the relationship itself? I want to understand how Duvo originated, whether that was inside the company, and any details you can provide.

Expert 00:02:48

It was proposal of the founder to work with them. We just evaluated platform functions and maturity against other solutions on the market briefly. Objectively, if you are searching for a platform which will be really user-friendly for users to build agents in natural language. It's AI-first platform where you just describe your problem process in human way, non-technical. Duvo is really something which was more advanced than other alternatives which we saw on the market. It was triggered, the discussion, by founder, but we decided objectively based on quality of the platform. We want to use it because this will enable wider business users to build agents.

Client 00:03:30

Got it. Could you give us examples of the type of agents that have been built to date with Duvo?

Expert 00:03:36

For example, we have agent which is checking possible out of stock. That means that, if we would run out of the stock of some SKUs, **it evaluates and triggers emergency order from alternative supplier**. It's adjustment of SKU-level demand forecast, and then executing of the actions. We have also agent, which is evaluating purchase prices of the products with some market environment, commodity pricing, and so on. Pricing, if we should have better price, if there is some potential for improvement. We have agent which is summarizing and providing vendor's data regarding their quality of execution. We have also agent which is reviewing master data in one part of our system. Is it valid examples? Do you need some more?

Client 00:04:22

That's fine. How many agents do you have in total? How many different workflows are you guys covering with Duvo?

Expert 00:04:31

In production, I would say generally it's in the matter of hundreds.

Client 00:04:35

Okay. How do you actually come up with these workflows and agents? How does the process actually look like to go from a manual process to one that is automated by Duvo?

Expert 00:04:50

In Duvo, you already have a function which is supporting users in mapping of process. It's called Clarity. On some simple processes, it works. You will describe in normal human-based text, or they also have functionality that you can just record your process, the screen, and it will create SOP description. This works already for some simpler processes. If we have something more complex, like promotion management, usually, how we approach it is that you have some process person from Rohlik Group, some process manager who is skilled in the domain where we want to automate. Firstly, he's creating process description, and then he's working directly in the platform on creation of the agent.

Generally, what is our experience so far, if you want to do automation on Duvo, even though it's user-friendly, the best persons to automate are process managers, operational excellence. Generally, this process-based structured persons, they work the best in the platform.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:05:50
Usually, how long does it take to go from a manual process to one that is fully automated?

Expert 00:05:55
This really depends on quality of your systems. It's very different to create agent on some stable system. If you have SAP, and you have very clear path to create an agent within day, you create definitely agent even faster, usually, you will find out that you are missing some API connection, for example. If you have some high volume agents, rarely, you want them to interact directly each step in your UI in front end, because this is not reliable. Usually, you want them to connect to database, use APIs. Of course, it depends on how fast you can adjust this legacy manual process.

Generally, I would say it's a really simple process where you need no adjustment of infrastructure. Within one day, you will have it running. If you have something complex to polish it, trial it in the scale, and then modify. The biggest ones took us single weeks.

Client 00:06:49
Got it. That makes sense. Earlier, you mentioned that you had evaluated other solutions. Could you help us understand who you evaluated Duvo against and what the evaluation criteria looked like?

Expert 00:07:04
Yes. I had experience, and I was part of evaluation for Duvo, n8n, and UiPath. The issue is that it's not direct competitors. I was checking, but I didn't find direct competitor to Duvo. Duvo is really AI-first, AI-native platform. That means that you are prompting your solution using LLMs and agents. They basically assume that agent is something which is executing your flow. If you look at n8n and UiPath, both of them are more like this classical robotic process automation, where you are defining in a more fixed way the flow. If you have some deterministic flow, like you want to execute something typically in finance, in a NetSuite or SAP, when it is about clicking in the same way to some buttons or fields, then n8n or UiPath is generally a better option.

Once you have some more loose task, which is, for example, evaluate if we have good purchase price, because then, I'm using also some public sources. I'm searching on internet. This is typically much better task for Duvo, where you don't have deterministic task, where you have some ambiguity. We just evaluate it against our needs. We are still using n8n, but we are evaluating at the start of each use case, "Okay. Should I build it in n8n?" **The challenge** is also that n8n, it's really low-code and building a chat, but it's not so user-friendly like Duvo. Our power users, they can build it. More challenging processes with LLM in Duvo generally. UiPath is something which we stopped recently to use. It's really rare, because we cover use cases which we would cover there with n8n.

Client 00:08:50
Okay. That makes sense. With regards to pricing, could you help us understand approximately how much it is that you pay for Duvo? Just an approximate ball figure.

Expert 00:09:02
I know we are paying per run of agent. A run of agent is that you have an agent and you will trigger him based on some trigger or based on time. Per this run, you are paying. More runs means more money. I can give you that we estimate that, on yearly basis, we will be in a high six-digit or low seven-digit cost.

Client 00:09:23
That's very helpful. With that in mind, how have you guys thought about the ROI? Say that you are spending those seven-digit figure a year. How does it fit? **How does the benefit** that Duvo's creating for the enterprise compare to that?

Expert 00:09:40
We actually create much bigger benefit. If you try to base it based on FTE saving only, we would make it, but **ROI would not be great**. Thirty, 40 FTEs, we are saving for sure, but that's maybe double these costs. Actually, the best value is derived from the processes which we were not doing before. That is, for example, this purchase cost evaluation. We have turnover of low ten figures, then purchase price will be in the high nine figure range. With this agent, which is providing intelligence on if we are purchasing well or not, you are able to derive some decimals of percentage point. That's already paying well for all the work costs.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:10:24

Okay. That makes a lot of sense. How much of Duvo is specific to e-commerce and retail and consumer packaged goods versus technology that can be used across industries?

Expert 00:10:37

The background of owner, he's navigating also the team to build specifically knowledge in e-commerce and retail. The platform otherwise is general. If you want to use it for process automation and you don't care that you don't have their pre-built cases, because Duvo works in a way that either you build yourself automation of processes, which is something which we prefer, because we have the capability, and we are fast. They are also offering that they will automate for you as consultancy. They are creating a database of these automations, which they then provide to another client. They are focusing really on e-commerce and retail, but platform itself, there is no reason why you would not use it for process automation elsewhere.

Client 00:11:09

Okay. That makes a lot of sense. In terms of switching costs, now that you have adopted Duvo, could you help **us understand if a competitor** came along tomorrow and you didn't have this relationship with Duvo, given the CEO, would it be easy for you guys to switch to a competing solution? **What would be the friction or the barriers to actually switching**?

Expert 00:11:33

This is a very valid point. Duvo is having MCP. You can connect, for example, with Claude. We were thinking about this emergency scenario. If we want to change, we would just mine the instructions of the agent, just move them to similar platform. To be honest, we don't have precise plan, because this is quite fresh. We don't have any problems with one year. This is one of the critical points which I would look at if I would be within the company, which doesn't have this relation to the owner. Have a mitigation and ask Duvo platform, "Okay. How good do you support movement of the agent?" There is no native solution. No one was, so far, working on this issue. From my point of view, it should work the same way.

Currently, if you are working with GPT or Claude, you can ask any platform, "Extract my context." You can extract to another tool. This is the way how we would extract also the data from Duvo. It's theory. I don't have exact process. I will need to work on it.

Client 00:12:39

Okay. Could you walk us through how Duvo is actually getting better over time or worse, if at all? How does the product improve? Do you see that once you create a workflow, it essentially does that job throughout time?

Expert 00:12:54

It's developing really super fast. This Duvo, it's in startup mode. It's not a big company. For example, when we started to collaborate, there was not functionality which is called case queue, which is like chaining agents one next to each other. You can have one agent which will process something and provide inputs to another agent, which is triggered by finishing the previous round, or you can have agent, which is doing repetitive work, for example, analyzes some lines of the database. In case you have each line analyzed as a separate case, you can properly control it with visibility. If there is failure, it's failure only in one row. It's not failure in 100 rows.

For example, this was developed last month. During last month, there is also development in this Clarity process mapping. Just an example. Now, you can manually intervene into the output. The chat which is generated, it was not possible. It's really super fast, and it's really based on customer feedback. Every month, you have better product, from my point of view.

Client 00:14:03

In terms of the workflows themselves, because I imagine within work something you're trying to automate, there's obviously exceptions that **AI might struggle** to adapt and understand how to be able to do something end to end, how do these exceptions get captured so that once a human has to intervene, then AI knows how to do it next time?

Expert 00:14:23

First point is that, in our design of the agents, we are requiring that **we have some fallback option**. If you cannot execute some critical steps, we are having, in design, "Okay. This is workaround." For example, if I'm not able to execute some action, I will call a human in the loop to resolve. That's one point.

Second point, which Duvo is working on, and that was not in production last time when I checked, but they are working on a feedback loop. Once you finish a run of the agent, if in case there is some failure, you will learn and improve your prompted solution to overcome it. That's the second point, but that's not fully resolved.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Third point is that they are using what is called evaluation. For every run, in case it fails, you also have some basic root causing. Is it technical failure? Is it that there was timeout of API? Is it because, for example, some resource which I should have used was not available? You have transparency on these.

Of course, if you are pointing to direction, what's the success rate of the agents? Our target internally is, on those in production, I want to be at least 96, 98+, without human intervention. It's about selection of the two. You should really use Duvo only for these non-deterministic tasks. If you have something deterministic, as I said, I need to click into five reports all the time the same way, and then write some number to another report. It's much better if you do it, for example, in n8n, and when you define the flow and don't rely on LLM, because you don't need it. LLM, by definition, will always have some small percentage of hallucination and failure.

Client 00:16:06
That makes a lot of sense. In terms of usage, who's the actual user day to day of Duvo? Is it the IT team? Is it the people who actually produce the workflow themselves?

Expert 00:16:20
The point of implementing Duvo was that we don't want IT people to do it. With IT people, the problem is that, usually, they don't have context. They don't understand business problem. They focus on technical solution. We have a group, which is called power users. Per each domain in the company, which is finance, supply chain operations, and so on, you have one power user, which was trained in usage of the platform. We are training these people not only in Duvo, but we train them in some basic technical tasks. For example, every one of them understands what is API and how can I positively build it using agentic tools like Devin. We are training them also with n8n. They should be able to decide at the beginning, "Okay, should I even build it in Duvo, or should I use something else?"

If in case you have bigger department, each of these power users also have some structure of champions. For example, if operations and supply chain organization is big, you have power user on group level and you have champions per country. These champions, they are also working on building the agents. Ultimately, per each domain, before you release something to production, for production, it means that either you are writing with agent something to database, or you are really clicking to some system, or you are having communication with some external people from the company, like vendors. This we call in production. You need to review as a power user the risks with other software. You want to check it out.

Client 00:17:58
In **terms of the strengths of Duvo**, if you had to name the top three things in one, two sentences that Duvo does, what would it be?

Expert 00:18:06
For sure, I would already call strength that you have this dual quality, assistant for process mapping, because this is usual. For us in Rohlik, it's not such a big problem, because we have advanced process department. I see huge value for maybe less advanced players. You can really record screen and it will create for you SOP, process description. That's really great. You can directly use it for building agent. That's one thing.

The second thing is really the UI itself for building agent. You really start with normal description of the problem. You can easily iterate in building it. The third one would be this case queue. You already have option that you don't look at agents in its isolated way. You are building these chains and interrelations between agents, and it's quite transparent. You can really understand, as a user, what is happening.

Client 00:19:02
Okay. That makes a lot of sense. What about the weaknesses? What are still things that Duvo needs to improve or that you want them to work on?

Expert 00:19:16
For example, I'm requesting from them some enterprise-level overview. There is quite a good overview per these cases and per departments, but enterprise-level overview, **what is happening cross-department, what are the success rate of the agents**, you can build it with their MCP on spot, but they don't have now the solution. They claim they will work on it, but if you want to scale up in big organization, they don't really have all the tools for transparency. That's one point.

Second one, we are yet starting to work with them on critical incident reporting. You definitely need to have with such a platform an integration of incident reporting to some of your systems. They didn't have it yet. Again, that's something they want to build, but that's the second core functionality, which I don't have yet.

Maybe third one, but this is by nature. If Duvo should be complete automation platform, it should support also better automation of these

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

deterministic flows. The platform is tending to use LLMs and AI-based agents where possible. For some cases, you don't want it. For some cases, you really want to have some script or really narrow solution. This is where the platform is not navigating users. You still need to have some user who is at least high-level thinking if this is the correct way how Duvo is building the solution.

Client 00:20:38

Okay. That makes sense. How are you thinking about expanding your usage of Duvo? Do you feel like you've already done automating most of the workflows that can be automated? Do you still think there's a lot of room for you to continue automating different ones?

Expert 00:20:56

For me, it's a question if we do it with Duvo. Maybe yes. It depends on their evolution. You really want to have the system where you have agents which are orchestrated by agents. For example, if you ask for exceptions, exception should be resolved by another agent in future, which is trained to resolve exception. You should have different layers. For example, supply chain department, for me, would be few agents, which are driven by management agent in supply chain. Currently, Duvo is not yet ready, but personally, I'm not sure if some platform is ready because this is automated operations of a big enterprise. I believe Duvo can get there.

Client 00:21:36

Got it. If not Duvo, what would you use for that?

Expert 00:21:41

As I said, I don't see it currently in the market. **More enterprise-level solution is, for example, this UiPath, but the problem with UiPath** is that it's really focused on standard RPA. You don't have this option with their UI agents. Some combination of Duvo AI-driven plus UiPath, enterprise-level of transparency, robustness, and so on, that would be, for me, the solution. Maybe there's something, but I don't know personally.

Client 00:22:08

That makes sense. If you had to rate your satisfaction from 1-10, what would you rate it?

Expert 00:22:15

I am on seven.

Client 00:22:16

What would it take for it to become a 10?

Expert 00:22:20

Ten is this enterprise-level transparency and resolution of incidents, integration to our systems, and this native exception management, and feedback loop to improve agents. That would be the main point.

Client 00:22:34

Is it currently not integrated fully into your systems?

Expert 00:22:37

Partly, yes. If you consider integration that you have access via MCP to our database, we are using Snowflake, then yes. This one, we have integrated. For example, we don't have yet integration to Datadog, which is incident tracking solution. For me, Duvo should report incidents in the standardized way. We have incidents reported from other systems internal. If agents stop working, it should work on ordering from vendors. It's the same critical incident like if my internal solution is not working.

Client 00:23:13

Okay. That's very helpful. Thank you very much for your time and have a great rest of your day.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.
