COMPANY DEEP-DIVE

Partner Director DACH at DRUID AI Believes Sierra.ai Needs Strategic Refinement for European Market Success

DATE PUBLISHED	INTERVIEW DATE	EXPERT PERSPECTIVE	ANALYST PERSPECTIVE	PRIMARY COMPANY
06 Oct 2026	08 Jul 2026	Consultant	AI Interviewer	SIERRA.AI

SMART SUMMARY

Summary

The conversation covered a detailed evaluation of Sierra.ai in a European fintech RFP, including use cases, pricing, technical fit, and competitive positioning versus other AI customer experience vendors. The discussion also addressed market dynamics, product gaps, and the challenges Sierra.ai faces in the European enterprise segment.

EXPERT BACKGROUND

- Partner Director DACH with direct experience as key decision maker in an RFP process evaluating Sierra.ai and other AI customer experience platforms for a European fintech SMB.

EXPERT SENTIMENT

- Sierra.ai is growing rapidly and investing heavily, but its product and European market fit need improvement to justify its valuation and win more enterprise deals.
- **The expert sees Sierra.ai as lacking clear strategic positioning between being a core enterprise front door and a tactical automation layer, and is uncertain about its long-term differentiation versus incumbents and other AI-native competitors**.

TAKEAWAYS

- Sierra.ai was a finalist in a rigorous RFP process for a fintech SMB, evaluated alongside Decagon and Five9, but ultimately was not selected.
- Key reasons for not selecting **Sierra.ai included weaker language and voice quality**, especially for German, and less proven European market references compared to competitors.
- Sierra.ai's pricing was premium and outcome-based, **which was less** attractive than transactional models preferred by the buyer; projected performance metrics were seen as optimistic, especially for B2B use cases.
- Integration capabilities were generally on par with competitors, but some technical adjustments were needed due to data security and compliance requirements typical for fintechs.
- The expert sees the AI customer experience market as highly competitive, with rapid growth, ongoing M&A, and evolving pricing models; Sierra.ai must improve product quality and European market fit to drive expansion and retention.

Expert Bio

Partner Director DACH at DRUID AI. The expert can speak to evaluating Sierra AI and was a recent customer of Intercom and NICE. Founder at Tweak.ist. Reporting to the Board, the expert is responsible for transforming complex business challenges into measurable growth through Artificial Intelligence and automation, including automating customer journeys, implementing intelligent chatbots, and optimizing Customer Relationship Management systems for team effectiveness. Prior to Tweak.ist, the expert was the Group Head of Customer Care at Vivid Money, leaving in August 2025. Reporting to the Chief Operating Officer, the expert was responsible for enhancing customer care operations by streamlining operations across multiple locations, enhancing service delivery through Artificial Intelligence automation, and fostering collaboration with various departments for a unified approach to customer service. The expert is a current customer of Parloa and has been involved in the Request for Proposal process for Lovable, Dust.tt, Sana Labs, Cognigy, Connex AI, and

Druid AI. The expert can also speak to evaluating Langdock and n8n. The expert has implemented agentic Artificial Intelligence capabilities across both chatbot and voicebot solutions to streamline internal knowledge management, assisting teams in retrieving, organizing, and contextualizing data for internal and customer-facing use cases.

Interview Transcript

AI Interviewer 00:00:00
Today's conversation focuses on how enterprises are adopting Sierra.ai for AI-led customer experience, what value buyers see, and how durable its position is versus alternatives. We will be drawing on your direct experience advising on, evaluating, implementing, or benchmarking Sierra.ai and AI customer-based platforms rather than general industry opinions. Topics will span adoption and spend, use cases and outcomes, implementation friction, pricing, competitive positioning, and long-term durability. I would ask that you keep responses concise and experience-based, ideally under two minutes each. To start, can you confirm whether your own organization currently uses Sierra.ai? If not, what is your closest basis of direct visibility into it?

Expert 00:00:51
Sierra AI is not used by my current organization. However, they were in a selection process, in an RFP process that has happened in Q2, Q3 2025, out of which **we down**-selected another vendor. They were part of the RFP, and we have thoroughly examined them, as well as other players. I was the KDM in that specific RFP process.

AI Interviewer 00:01:16
In that RFP process, what stage did Sierra.ai Reach before being down-selected? Did they get to a proof of concept or demo stage, or was it more of a paper evaluation?

Expert 00:01:29
No, they went through all the stages of the RFP, and they got in the last three. They were selected in the last three for the final decision. We had the opportunity to not only evaluate the offer but to see a presentation, to see a demo, use case built specifically on data which we have provided, with real-life examples anonymized. We saw them in action.

AI Interviewer 00:01:57
What verticals and company sizes were represented in that evaluation context?

Expert 00:02:02
It was for a fintech, which was an SMB, a scale-up with a size of roughly eight to 900 employees operating in all European EEA countries.

AI Interviewer 00:02:12
What were the primary customer contact channels and scope for that evaluation? Web chat, voice, email, or others.

Expert 00:02:21
All which you mentioned.

AI Interviewer 00:02:22
What was the initial pain point or strategic goal that triggered the evaluation? Was it tactical support automation, chatbot replacement, contact center transformation, or something else?

Expert 00:02:35
It was actually a mix of all the three, which you mentioned. It was about replacing an existing chatbot solution **which was not performing as per the expectation**. It was about opening voice as a new channel in customer care and obviously bringing all the channels under one roof, which is web chat, voice chat, and email as such.

AI Interviewer 00:02:55
When you say **the existing chatbot wasn't performing** as expected, what were the specific gaps that drove the replacement decision?

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Expert 00:03:03

There were **a lot of inefficiencies in the workflows**, which required high maintenance and a lot of human intervention, resulting in higher cost. It was the underlying LLM **that was hallucinating and providing wrong information to the clients, generating low customer experience and bad ratings**. Overall, **a customer query was not always performed well, and there were a lot of inefficiencies in terms** of communicating with the document base, which at that time it was highly unstandardized. We had information residing in different sources of data, repository, Word documents, emails, PDFs, and all sorts of local shared drives. **It was also primarily the inability of the AI** to orchestrate pulling in information from different data sources as well.

AI Interviewer 00:03:50

What was the approximate monthly customer interaction volume for that account across all channels?

Expert 00:03:56

We were looking roughly at around 50,000-60,000 interactions a month on the channels which were supported back then.

AI Interviewer 00:04:04

What was the broader customer experience or contact center technology budget for that account? Can you give a rough band?

Expert 00:04:14

Yes. It was, first of all, an in-grown solution based on existing third-party solution, which for that it was initially developed internally. The cost of the license was not a problem, but the high dependency on manual work and additional tweaks and configurations and adaptations was high. At that time, we were spending roughly between $100,000-$120,000 a month for all those incurring costs, including licenses and everything, without quantifying the manual effort and time of the people in the product team, in the customer experience and customer service product team to make all those changes happen.

AI Interviewer 00:04:53

What was the annual contracted spend range that Sierra AI was proposing in their offer? Can you give a broad band?

Expert 00:05:01

They proposed roughly between $140,000 and $160,000 per month. You can calculate it of the range, but there's also included the new channels and the implementation, which was a one-time fee in addition. Again, we were looking at broadening the types of interaction in customer care, so it would have benefited in all ways as a total solution with that price.

AI Interviewer 00:05:25

What was the one-time implementation fee they quoted in broad terms?

Expert 00:05:30

Roughly $20,000, $25,000, including the pilot of one to two months.

AI Interviewer 00:05:36

The vendor you ultimately selected, how did their pricing compare to Sierra AI's range?

Expert 00:05:42

Quite similarly. It was not so much of a difference. The differences were maybe $10,000-$20,000 a month or $10,000-$15,000 a month, was not really significant, within a 10% range or even less.

AI Interviewer 00:05:58

What were the decisive factors that led to choosing the other vendor over Sierra.ai?

Expert 00:06:04

I think the better language compatibility with all the European markets which we were serving, because we were serving 16-18 languages. The quality of the transcript and of the voice integration was actually the key decisive element. **That resulted, of course, in higher**

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

accuracy, higher customer satisfaction. At the same time, of course, the ROI was also calculated around the fact that the strategy which the competition vendor offered was aiming at reducing the cost per resolution economics, and reducing the overall cost that we have at that time per transaction.

AI Interviewer 00:06:43

On the language and voice quality point, was Sierra.ai's gap specific to certain languages, or was it a broader multilingual limitation across all European markets?

Expert 00:06:54

It was a broader limitation, I would not say to all European markets, but one of the main tests language which was one of the most important markets was German. For German, definitely other vendors scored in quality **better than Sierra**.

AI Interviewer 00:07:10

Were there other dimensions where **Sierra.ai stood out positively during the evaluation, areas where they outperformed the competition**?

Expert 00:07:18

I wouldn't say they outperformed the competition in any way, but they were on par with the different aspects like technical setup, speed of implementation, solution offered, support offered, similar business case and success metrics, dashboarding, and so on and so forth.

AI Interviewer 00:07:34

Which other vendors made it to the final three alongside Sierra.ai?

Expert 00:07:39

That was Decagon and Five9.

AI Interviewer 00:07:41

Was Five9 evaluated primarily for its contact center infrastructure, or was it also competing on the AI agent layer?

Expert 00:07:50

Five9, you mean?

AI Interviewer 00:07:52

Yes.

Expert 00:07:53

They were competing on the same thing, but they were pitching their GenAI Studio solution as a practical AI with a bottom-up agent assist coaching rather than a full autonomy first. In the end, that was good for orchestration, but it was too complex for the type of setup we were needing at that time because we didn't implement so many AI agents, of course.

AI Interviewer 00:08:16

Decagon, what were their relative strengths and weaknesses compared to Sierra AI in that evaluation?

Expert 00:08:22

Primarily, as I said earlier, the language quality and the capability. Of course, they were playing same as Sierra in the AI native pure player tier. Also with agent first, but premium pricing. Of course, we knew it was supposed to have a longer enterprise onboarding, but I think when you look at the ROI, **which was calculated to reduce significantly the cost per resolution** and increase the credibility check. Decagon having definitely a better industry fit in different verticals, including fintech, which we were also interested in. **The fintech affinity and the compatibility with the success cases from different geographies, not only in U.S. for banking and financial services, including fintechs, was definitely a key advantage for them**.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:09:10
Just to confirm, Decagon was the vendor ultimately selected?

Expert 00:09:14
Yes. In the end, it was Decagon. Correct.

AI Interviewer 00:09:19
Let's move to use cases. What were the primary use cases Sierra AI was expected to handle in that deployment? Were they primarily informational, or did they involve end-to-end task completion across systems of record?

Expert 00:09:33
A mix of both. It was not so complex, but if you look at the customer care front office implementation, the required bots, which were chatbot and voice, supposed to pull information from different sources and provide the first time resolution or a first accurate response to B2B and B2C clients. For B2B, obviously, it was a bit more straightforward and easier processes to manage. For B2C, **it was a bit more complex cases because you needed different sanction checks**. You did different onboarding forms to be pulled out and provided different conditions, more information about the tiering for different layers of business and differentiation between founder, solopreneur, enterprise, large company, type of the company to be founded, and in the legal entity type and so on and so forth. It was involving more in-depth task thinking and more complex operations to be handled.

AI Interviewer 00:10:31
Which enterprise systems was Sierra AI expected to integrate with for those task completions? CRM, billing, order management, or others?

Expert 00:10:41
CRM, customer data management, billing, and ERP system for finance.

AI Interviewer 00:10:47
Were there **specific integration concerns or bottlenecks that came up during the evaluation for any of those systems**?

Expert 00:10:54
Not as such because they provided native integration through APIs for all the tools which we used in the company. However, some primary testing required longer than expected because the integration had to be debugged and tailored a few times because of different data security layers that were implemented in our own systems as us being a fintech and obviously having more of a restricted API key landscape. That connectors landscape. Rather than that, it went through. I forgot to mention, it also required integration with Salesforce, which was our sales outreach and customer acquisition management system used by sales and account management as such. It was also an implementation aspect to be considered.

AI Interviewer 00:11:39
How long did the overall evaluation and demo process take from initial trigger to the final vendor decision?

Expert 00:11:45
Roughly one and a half to two months, because we had to undergo also the technical fit and the technical checks. Not only the demo and the features of the product, but also the technical integration, as I mentioned, which was an internal assessment process, which also included IT, product, compliance, legal, because we looked at all the compliance of where data is stored, where are the servers lying, which data gets transmitted and where. A lot of regulating frameworks which need to be considered. SOC two compliance, DORA compliance, and other GDPR and other European-related regulations.

AI Interviewer 00:12:23
Which function or role was the final decision maker? Was it CX, IT, executive, or a combination?

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Expert 00:12:31
It was a combination of CX, operations, product, IT, and compliance.

AI Interviewer 00:12:37
Let's move to outcomes. During the demo and proof of concept phase, did Sierra AI provide any specific performance metrics or resolution rate estimates for the use cases they demonstrated?

Expert 00:12:50
Yes, they provided some use cases from different implementations, and which were the achievements which they were able to achieve. They also provided a rough estimate about what they could do for us, but that was just underlying assumptions based on the available data which they had, and which we provided based on the number of transactions, average handle time, customer satisfaction scores, and so on and so forth.

AI Interviewer 00:13:17
What resolution rate or containment rate did they project for your specific use case in broad terms?

Expert 00:13:23
75%-80% first time resolution, **which was a bit unrealistic, specifically for B2B.** It was an overall rate, but that included both B2B and B2C, while for B2C that was realistic. For B2B, it wasn't so realistic because there were a lot of manual handoffs required, tickets to be routed to other departments to be checked. Of course, some checks were due to be automated, but again, it was a lot of non-standard cases which couldn't fit into this expectation.

AI Interviewer 00:13:56
How did Sierra AI's projected metrics compare to what Decagon projected for the same use case?

Expert 00:14:02
Decagon was a bit more conservative, and I think for the right reason. I'm not sure if this was a strategic or strategy of not over-committing or playing it safe, but in the end, the numbers proved more realistically to the board. When they were down selected, the business case made more sense in the check itself from a realistically expectations of the business, but also of what such a solution can bring in the respective suggested timeframe.

AI Interviewer 00:14:31
What timeframe did Decagon project to reach their target metrics? Was it three months, six months, or longer?

Expert 00:14:40
Nine to 12 months minimum.

AI Interviewer 00:14:43
Let's move to pricing. How did the buyer team perceive Sierra AI's outcome-based pricing model? Was there comfort with how outcomes would be defined and measured, or was that a concern?

Expert 00:14:56
It was a bit of concern because outcome-based pricing was not what we would have hoped for. We were looking at a more transactional pricing without outcome commitment. Of course, outcome from the vendor side were looked into as part of a bonus-malus system and as part of a committed minimum guaranteed outcome. Also, even so, if that wouldn't been reached, that wouldn't have had major implication on the contractual aspect from a vendor perspective. We looked at the more grounded pricing based on a transactional model, because for the business case that **we had, reducing the number of contacts and automating most of the contacts was also a very direct, clear CX level mandate aiming at cost reduction** and improving customer experience.

AI Interviewer 00:15:44
Did Sierra AI have a contract minimum **that was a concern, or was the pricing structure itself the main friction** point?

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Expert 00:15:51
I don't exactly recall all the details. I think it was a mix of both, but mostly the second one was a bit more, not concerning, but a bit more less realistic.

AI Interviewer 00:16:02
Let's move to competitive positioning. Beyond the final three, were there other vendors evaluated earlier in the RFP process, and if so, which ones?

Expert 00:16:13
There wasn't anyone evaluated earlier, but of course, before the three entered the final decision, there were other three which were part of the selection process.

AI Interviewer 00:16:22
Who were those other three?

Expert 00:16:25
Intercom, NiCE, and Zendesk.

AI Interviewer 00:16:29
What caused those three to be eliminated before the final round?

Expert 00:16:34
Technical fit and quality of the demo, and the pricing model or pricing structure.

AI Interviewer 00:16:40
On the technical fit point, were there specific gaps that disqualified them, or was it more a relative ranking against the final three?

Expert 00:16:48
It was a relative ranking, but to be upfront, Zendesk was clearly a very good solution, but primarily for the written part. The voice part wasn't so comparably developed, I would say, given the broad mix of languages that we had to deal with. NiCE was competing strongly. Again, there were **some agentic AI concerns in the quality** and the speed of reaction from a technical standpoint, because, for example, for the voice piece, it didn't feel quite natural to have a long gap in the reply sequence. Intercom, that was purely price-related. One of their greatest pluses was the native integration with Salesforce, but we struggled with them a bit on the technical integration. In the end, that wouldn't have been the primary decision-maker, but pricing model-wise, they were not into what we have been looking at.

AI Interviewer 00:17:38
You mentioned NiCE. Was that NiCE CXone or a different NiCE product?

Expert 00:17:44
No, CXone.

AI Interviewer 00:17:46
On Sierra AI specifically, what was the biggest gap between their marketing claims and what you observed in the demo and evaluation?

Expert 00:17:54
They had some business cases where the numbers seemed too good to be true. They had some customer references, and **that was a bit of concern** looking at the numbers.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:18:04

Were those references primarily from U.S.-based companies, and was **that part of the concern** given your European context?

Expert 00:18:12

Yes, that was also part of the concern. Agree. **They were quite strong on the U.S. piece** and did not have so many references in Europe. Of course, there are always those differences in terms of adherence to specific norms in Europe, which at that time were still under development, I would say. **They were very strongly** providing with a U.S.-based footprint rather than a European already market success base rate.

AI Interviewer 00:18:39

Let's move to durability. Based on what you observed, do you see Sierra AI positioned to become a core AI front door for enterprise customer interactions or more of a tactical automation layer? What conditions drive either outcome?

Expert 00:18:55

I'm not quite sure what they want to become. I can't say for sure if it's the one or the other. They are currently developing a lot in the sense of anchoring themselves on large retail and consumer brands mostly. Maybe that's a focus which is less than banking. They are now in Series E as recently funding. They're growing a lot. They're increasing their valuation, so **they growing a lot**. I think they want to grow as a whole, and not sure if their strategy or the niche positioning for them is very clear, because they acquire some companies, and it's not yet clear to me in which direction they will go, if it's going to be the first or the second one you mentioned.

AI Interviewer 00:19:38

What would cause an account that selected Sierra.ai to expand spend? What would need to be true 12 months in?

Expert 00:19:46

I can say that we haven't selected Sierra AI, so I don't know, to be honest. I can't answer that.

AI Interviewer 00:19:56

Based on what you observed in the evaluation, what would you expect would need to be true for a European enterprise to expand Sierra.ai spend, drawing on the gaps you identified?

Expert 00:20:07

They need to definitely improve the technical solution, or the language accuracy. They need to work on improving their product in pure terms. Expand their footprint with European use cases and get **some success stories** there. If the customers are happy and satisfied, that will help them obviously grow their existing engagements with their existing clients, and obviously by recommendation and referral based on their success, acquire new clients in the same verticals from the same geographies.

AI Interviewer 00:20:37

On the flip side, what would cause an account to replace Sierra.ai if they had selected them?

Expert 00:20:42

If the projected outcomes are not materializing and the quality and the customer experience is not increasing and the quality of the product is not improving, then definitely if the expected ROI is not materializing, one customer can go into a new RFP in a matter of one or two years maximum. The technology is evolving, pricing is evolving, cost reduction and outcomes are becoming more paramount, and costs are very important. At the speed in which the market is moving, definitely a company will look elsewhere again if in a matter of maximum two years the desired ROIs are not materializing.

AI Interviewer 00:21:21

How do you see Sierra.ai's differentiation evolving as contact center incumbents like Genesys and NiCE and CRM **suites like Salesforce agent force continue to improve their agentic capabilities**?

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Expert 00:21:35

I think Sierra will continue to play in the premium pricing, a lot of the enterprise, the higher enterprise model. While we have CX incumbents retrofitting AI mostly via acquisition, NiCE, Genesys are such example, but also Five9 and Zendesk. We have also those hyperscaler CRM platforms who also integrated agents into their existing footprint. Like, I do not know, Salesforce agent force, Copilot Studio from Microsoft, or CAI from Google. It is a $15.8 billion valuation on around $200 million ARR. Incumbents are buying capability and not building it. You saw NiCE buying Cognigy rather than build agentic internally. Zendesk bought Forethought. Salesforce is acquiring Intercom outright. I think with the smaller acquisitions that we see recently and with the investments that Sierra is doing, I think they are on the same path.

However, they have not yet come to a big acquisition or a big name so far. We have those smaller things like Weight Watchers, Sonos, SiriusXM and so on. We need to see how this will definitely look into the future. Of course, we have agentic AI containment, we have cost per resolution, deflection. These are also some important metrics where the competition will make a difference in the space.

AI Interviewer 00:23:10

You mentioned Sierra sitting at roughly $15.8 billion valuation. Does that valuation seem justified to you given the European footprint gaps and the competitive dynamics you described?

Expert 00:23:23

I think they are up to something. I can't judge that. If it's good or bad. Definitely, they are on a huge investment track. They need to work on improving their product, because you have a 41.2 median tier one deflection with a 58.7 top quartile, 65%-80% for structured system of records intents. The adoption reality is clear. Almost 90% of contact centers have deployed AI in some form or shape, but only 25% of them, a quarter, have really operationalized it into measurable ROI on a day-to-day basis. It is still a market that needs to up its game and become more competitive. **It will become more competitive given the fierce competition**. Important is also the cost per resolution. AI versus human.

We have roughly looking at a $0.6 per AI cost per resolution versus a blended human rate which still sits at around $6-$7. If you do a global aggregation, but on the higher end, there is such number in Europe. There is really room for that.

AI Interviewer 00:24:40

We have a few questions remaining. On the capability side, which specific Sierra.ai capabilities did **you observe as hardest** for an internal build to replicate based on what you saw on the evaluation?

Expert 00:24:53

I don't think they had something which others could not replicate. I don't remember that. Definitely, what they need to replicate better as the others is from a qualitative perspective, the seamless integration and the quality of the Large Language Model for both text and voice. The telephony piece and the naturality of the voice is quite important here. Also, they need to revise their pricing model to shift in the ROI math to be competitive. We have this Intercom cost per resolution, which is interesting, but still expensive for some companies, versus a generally different budget exercise for a KDM to have turning AI cost into a variable line that scales with volume rather than a fixed seat count or a fixed seat price per resolution.

It's a different budget exercise than the Software as a Service seat model most of them vendors came from. That's the shift that needs to happen for Sierra, but it's also an interesting point for the competition to look at, to align on a different pricing model that works best for the market and for the industry in which they operate, for the customers acquiring their services. Every industry has a different dynamic. Some industries sit more on cash than others. **Cash flow can be an issue for retail**, but for example, it's not an issue for an insurer or for a bank. Those type of dimensions need to be adjusted for the go-to-market strategy to be able to cope with the respective client's needs when they decide which pricing model, and how they do the ROI calculation selection will apply.

AI Interviewer 00:26:30

Final question, what do you think outsiders or investors most commonly misunderstand about Sierra AI and the broader AI customer experience agent market?

Expert 00:26:39

I think it is a high hype now. **Everybody is trying to invest, to grow, acquiring smaller competitors**, getting them stronger from a market, getting a piece of the market share, developing a model that will drive more business, and it is about the go-to-market strategy. People ignore the fact that look at what Gartner is predicting by end of 2026, **that conversational AI is projected to save** $80 billion in global contact center labor costs. That is a huge pie and it is a huge commitment. **The problem** is who is going to make this happen, which vendor will be better positioned to absorb this? The AI customer service market is quite a competitive one, and it is looking at growing. We have a call center AI market of $3.25 billion in 2025.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Now **it is already $4.15 billion, almost $1 billion since last year with a predicted growth of 27.5%**. Similarly, we have an 18%-21% CAGR rate in the CCaaS market. Also, **the AI customer service market is predicted to grow by 26%** yearly. **It is a huge growing** market, but I think the underlying assumption for the investors is which companies are taking the best and bold move to grow? It depends on their acquisition strategy. I just mentioned earlier whom has acquired whom. The question is, would those acquisition make sense? Will they really bring the added value which they were brought for? That is the game. If the cost for the acquisition will not materialize in revenue, market share growth, and new customers, then obviously, **some of those bigger elephants in the market will lose the battle,** and they will go out of the game.

AI Interviewer 00:28:30

Do you have anything more to add on that topic before we close?

Expert 00:28:34

No, not really. Rather than maybe if you would ask me which vendor would I personally recommend today, it is hard to say. It is again about the bet. I would rather deflect to a framework rather than a single name. It will always depend on the fit, on the intent mix, on the integration complexity, the organization's appetite to build their own or buy outside, on the regulations, on the compliance aspects. It is always pointing at a containment resolution number that does not disclose what is excluded from the denominator. That is a good defensible, I don't fully believe X answer. Which was also something which we have observed with Sierra in the RFP. Again, how will pricing evolve? I mentioned earlier, per seat, moving to per outcome consumption pricing with hybrid minimum commitments. It is still common, but this is a transition period guardrail.

Everything will change into the new dynamics, into the cost consciousness **that has emerged in the last 18-24 months and will continue to be even more fierce**. As I said, last but not least, again, recapping the post-M&A integration risk. Would any of those acquisitions really pay? Maybe some of them, other not for some vendors with the risk of going out of the business.
