COMPANY DEEP-DIVE

Former Head of Engineering at *11x*.ai Believes *11x* Has an Edge Over Competitors Like Apollo and HubSpot in *AI* *SDR* Market

DATE PUBLISHED	INTERVIEW DATE	EXPERT PERSPECTIVE	ANALYST PERSPECTIVE	PRIMARY COMPANY
29 Jan 2025	31 Oct 2024	Competitor	Investor-Led (Buy-Side)	ARTISAN AI

SMART SUMMARY

Summary

The interview covers the competitive landscape of the AI SDR market, focusing on the strengths, weaknesses, and future prospects of two leading companies. Topics include product differentiation, technical and distribution moats, company culture, and the evolving nature of product market fit in the space.

EXPERT BACKGROUND

- Former Head of Engineering at an early-stage AI SDR company, responsible for shipping 60% of the codebase, managing the initial engineering team, and deeply involved in product development and go-to-market ramp-up.

EXPERT SENTIMENT

- Believes **the company's early mover advantage and unique marketing positioning have been key to its success, but is skeptical about the existence of a strong technical moat**.
- Expresses **concern about high employee churn and intense company culture, viewing these as significant negatives** that could impact long-term success.
- Is **skeptical that any company in the AI SDR space has truly found product market fit yet, citing challenges with ROI and evolving market needs**.

TAKEAWAYS

- The company was the first mover in the AI SDR space, leveraging a marketing innovation (avatar-based digital workers) rather than a fundamentally new technology.
- Distribution and use of their own product for pipeline generation are seen as key defensibility factors, rather than technical differentiation.
- Switching costs for enterprise customers are **relatively high**, but contract terms can vary, and there is a three-month break clause for many customers.
- The main competitor, Artisan, is viewed as having reached feature parity by copying rather than innovating, and both companies are racing to expand into broader verticals beyond sales.
- High employee churn and an intense, sometimes negative, **company culture are seen as significant risks, potentially undermining long-term growth and stability**.

Introduction And Expert Background

AI SDR Competitive Landscape

Technical Moats And Threats

Comparison Of *11x* And Artisan

Product Market Fit And Future Trends

Expert Bio

Engineer at Convergence. The expert is responsible for research and engineering and was an early-hire at the organization. Prior to Convergence, the expert was the Head of Engineering at 11x, leaving October 2023. The expert was responsible for hiring 12 engineers and overseeing their work on the product while also conducting hands-on engineering work. The expert was an early-hire of the business and played a pivotal role in product origination. The expert also had partial scope on the GTM side of the business. The expert can consult on engineering expertise (stockpiling), AI SDRs, domains (LLMs, pre-trained AI models), early-stage funding, DevOps, developer experience, cybersecurity & compliance (implemented SOC2 twice, and ISO2701 once), and sales and GTM from mid-market to enterprise. The expert can also speak to manufacturing quality standards ISO 9001 and AS910.

Interview Transcript

Client 00:00:00

Hi. Thanks for taking the time to talk with me. I am interested in learning more about the AI SDR market. To start out, I would love just to get an overview of, I know you worked at 11x previously, your role and experience at 11x and then what you've been up to since then.

Expert 00:00:18

I joined 11x actually before they were doing SDR. Very, very early, I was the first full-time employee. At some point in late January 2023, we pivoted to this outbound sales assistance. Essentially, my core contributions and output, long story short, was I shipped 60% of the codebase at my time of leave. I essentially contributed all of the core code, and then I managed the initial engineering team as well. Just for more info on 11x, we essentially were building pretty heads down to the first three months after coming up with this idea. We then started to ramp up go-to-market and sales after that. Obviously, now **it's a pretty successful business**.

Client 00:00:59

I think your bio says you're still in the ***AI SDR*** space or have you pivoted to something else?

Expert 00:01:05

Is this about ***11x***? Is ***11x*** sitting in the ***AI SDR*** space, did you ask?

Client 00:01:10

I'm just wondering because I know you left 11x. For the past year or so, what have you been doing? Are you still in the AI SDR space, or have you joined another startup?

Expert 00:01:21

I am working at a different company now. We are doing AI agents ,and so it is vaguely related to automating the workflows that sales reps do.

Client 00:01:29

Got it. Maybe we could start off with just understanding the AI SDR competitive landscape. You're still in the agent space, so I'm sure you've kept relatively up to date. What's your view on how 11x has scaled in relation to other competitors and who your view is of the main competitors?

Expert 00:01:48

In terms of the broad competitive landscape, 11x was certainly the first mover. You could literally scrape the web, they were the first company to have AI SDR and digital worker on the Internet in a business sense. **They have definitely retained that advantage in various measures**, obviously, fundraising by the measure of headcount, if you care about that as a measure of success, and then also revenue.

There are a couple of competitors. Artisan I think was essentially the next most number two, who were also the most serious. There are other companies like Nooks who are not explicitly positioned as a face, a name, and an AI-generated avatar. Instead of purchasing this software product, you "hire" the software product. It varies between these different companies and how they're marketing themselves, but in terms of the framing of an avatar with a face and a name and that, I think 11x.

Client 00:02:43

What's **your view of the success of a product like Nooks** which doesn't have the avatar versus something like Artisan or 11x? Which one do you think is more favorable?

Expert 00:02:54

In my personal opinion, I believe that marketing like 11x, it enables your buyer to immediately understand the value prop better. It's interesting. 11x was the first to market with this marketing innovation, but really the underlying reality of generating outbound already existed on Apollo.

You could almost call 11x essentially a company that reimplemented a functionality **that already existed in softwares, but simply just made a marketing innovation**. By that measure, clearly, it's more favorable to position yourself in that way. If simply you just take an existing software product, remarket it, and then scale it to a Series B, **it seems to be very favorable to position** yourself in that way.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:03:38

That brings me to my next question, which is, what do you think of the moats of a product like this? When to your point, Apollo already had the integrations, they already have the data, it'd be quite easy for them to just add a little bit of automation.

Expert 00:03:53

That's a great question. **I think essentially distribution advantage with 11x, in my opinion, and defensibility** comes from the fact that they use their own products and most of their pipeline generation is from their own products. A large portion of their pipeline is generated using their own products.

Client 00:04:13

Is this Apollo or 11x?

Expert 00:04:14

This is 11x. They're using their own product.

Client 00:04:18

Got it. They've built their own products to create pipeline and find new leads?

Expert 00:04:22

Yeah. They use their own product to generate leads for their product. **I do believe that the success of doing that,** and obviously all of these AI SDR companies are doing this. In terms of actual technical moat, though, they do not pre-train models. You could say that they're still a "wrapper" company. In my opinion, there's this way of thinking in the AI industry which is, "All these wrapper startups, they're just going to die because the foundational models are going to become so powerful that they're just going to sweep all these companies away."

I think that **thinking is actually flawed** because 11x's market segment is upper market and toward enterprise. All of the workflows that they have are extremely niche, and unique, and complex. It's like this fractal tree of complexity, where 11x is operating at the leaf nodes of this tree of complexity whereas the foundational layer companies are not. They do not care to verticalize really hard and expand this tree and solve all these problems.

I think in terms of technical moat, a lot of 11x's core business logic is derived from customer insights. The way that you mine those customer insights is by sitting on customer calls. You can only do that. Ultimately, yes, they don't do their own pre-training or anything like that. Does that answer your question?

Client 00:05:44

Yeah. It also gets into another question. Just focusing on the question of Apollo or HubSpot, basically, they're creating their own pipeline generation. Do you think that that creates a technical moat? I know Apollo, I think literally just yesterday, came out with some AI SDR automation products. **The question broadly is just, what's the threat of Apollo or HubSpot, who already have distribution, who already have a lot of customers, coming out with an *AI SDR* product and basically just wiping out *11x*?**

Expert 00:06:15

That's a good question. Typically, when these scale-up companies like 11x target large enterprises, in the contracts, they've got long-term lengths, and so **customers don't churn in enterprise**. For 11x's target market or ICP, the switching costs of dropping 11x and going to Apollo are quite high.

Client 00:06:35

11x, can't you cancel it? There's **a three-month cancel window** and you can cancel it any time as well?

Expert 00:06:41

Is that 11x you're talking about?

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:06:43
Yeah, I thought that the contract was relatively easy to break.

Expert 00:06:47
That's a break clause, yes. What I'm saying is that typically, the contracts vary between customers, and so I wouldn't be surprised if there are customers that don't enjoy that break clause. It depends on what the ICP is. For the majority of their customers, there is a three-month break clause. That's right.

Client 00:07:06
Then I guess going back to the question, would **it still be hard** for Apollo and HubSpot to wipe out 11x?

Expert 00:07:13
In my opinion, they do already have a lot more distribution power. It's hard to tell. I think that there's space for many players vertical. I don't believe in this winner takes all thing.

Client 00:07:24
Maybe I'll ask the question differently. Is there anything that 11x, and I'll just group in Artisan, offer because maybe they're a smaller startup, they're building from scratch? Is there anything that they offer that Apollo or HubSpot can't offer and therefore, there's some competitive differentiation or wedge that they're able to create within the market?

Expert 00:07:47
Appreciate you rewinding that. 11x's roadmap. A lot of these customers care about seeing product velocity, seeing **these features improving**, but then also the direction of the company. 11x is trying to sell work. That's really their core thesis. They're trying to change the pricing unit in the entire software industry. Really, what they're doing now is, as is teased on their website that they have a lot more digital workers coming down the pipeline that are also related.

They've got the Jordan, which is the outbound firmware app. They have inbound capabilities that they're also doing, HR outbound. I believe that for a customer that is looking to isolate some budget to buy software and replace humans, because that is explicit target for a lot of enterprises right now, people are starting to realize that they can actually just do that. I think **11x's roadmap is probably more favorable** because Apollo is a pretty broad product, but it's selling data at its core, but 11x is selling work. Work is more broad. I think I'd consider that.

Client 00:08:52
I see. What 11x is trying to become is different than what Apollo is trying to become. They're going at it from different ways, 11x is selling work, Apollo is selling data.

Expert 00:09:03
I agree with that summary. If you were to play out the timelines and see where we are in three, four years, I think those companies probably look quite different.

Client 00:09:14
Makes sense. As it relates to the options of companies creating their own SDR solutions, have you seen that a lot where companies say, "**11x's product isn't good** enough, we're just going to create our own solution." How big is that threat?

Expert 00:09:29
I believe that threat is extremely minimal in general.

Client 00:09:32
Why is that?

Expert 00:09:32
It's a good question. I think software today is extremely easy to build, and non-technicals don't actually understand this. All of the best engineers that **I know, including myself, the grunt** work of implementing code, you open your code editor, you start typing on your keyboard. We don't do that anymore. We generate the code, and then we verify the output of the code, and we make adjustments.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Now, you have to actually be a good engineer to do that because if **you're a bad engineer**, you can't judge the output of a good engineer.The point is that any winning company, competition on feature parity is completely dead. It's a completely dead end. Software is too easy. Distribution is extremely important and strangely enough, in my opinion, I think putting the cart before the horse in some sense, funding first is actually, it's like confirmation bias.

Client 00:10:25

Are you saying that the software itself is the commodity and where companies have the value is in the distribution?

Expert 00:10:32

I do believe that the industry is trending in this direction. The value out of a software engineer is trending to **zero** pretty rapidly. It becomes more of directing these AI assistants like Cursor. I don't know if you know Cursor or GitHub Copilot.

Client 00:10:47

The question was like, let's say that I am Microsoft, maybe I'm a smaller company than Microsoft, but I'm choosing whether to use 11x or just literally create my own 11x using some code on top of an OpenAI. **Your statement would actually confirm the fact that there is a really big threat of that** if it's super easy to create this.

Expert 00:11:09

No, I don't believe today that that characterization is accurate. One of the reasons, I think that 11x's product is now pretty comprehensive. It covers a lot of these edge cases and corner cases that you can only find from hundreds of hours of transcripts with enterprise customers because their workflow is so unique.

Concrete example, for a certain company with 1,000 seats on Salesforce, like hundreds of internal apps that are custom-built for different market regions. This is a big, complex tree to solve. Solving an integration between 11x and Salesforce to cover all those cases is pretty much trivial.

I think as the 11x team doubles down in solving these problems for enterprises, **they do pull away from the ease of just generating one of these products with a text prompt**. Today, as someone that writes code ten hours a day, seven days a week, the assessment of CodeGen tools for software engineers, it will get there one day, but you still can't just text to product.

That will exist in two years. Right now, it's text to landing page maybe, and then you have to do a little bit of manual work to then take that AI's output, let's say it's an HTML file, create an AWS account, spin up a server, SSH into the server, and copy that HTML file over to that remote server.

I think that there's a really good article called Situational Awareness by Leopold Aschenbrenner, which you should definitely read. He categorizes three primary types of AI progress. One is foundational model progress, one is algorithmic efficiency, but the third type, **which is very interesting, is called unhobbling the AI**. The way that AI today slots into our workflows, it's somewhat disjointed, and **it's a bit annoying**.

I don't know what your role is, but let's say that you're running this call with me. You probably have a notepad open or maybe you're using some kind of meeting recorder, and that's going to generate a text output. The transcripts of this meeting, you're probably going to paste that into Claude and talk about it a bit more, like Google some of these references, and then put all that into Claude and then open a new [channel], put it into Claude again to then resize. The workflow is a little bit disjointed. I think that was a little bit of a tangent. My point is that software is very fractally like building software products.

It's a very spiky and esoteric pursuit. What that means is that there are a lot of steps along the way where you need to unhobble the AI and shift the output right into the input of another AI and kick it along the road. I think in two years, all those kinks in that road will be smoothed over. Right now, you can't just spin up these products. I don't believe.

Client 00:13:55

Yeah. Basically looking at ***AI SDR***, specifically Artisan versus ***11x***. You mentioned that ***11x*** **had an edge in the beginning** and maybe still does because they were one of the first. I'm curious, fast forward a year or two, how do you think the competitive landscape stands as it relates to Artisan versus 11x? It feels like Artisan has innovated rather quickly, but I'm not sure if maybe **they fundamentally just have a worse team**.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Expert 00:14:23
That's an interesting point. I will say one thing, and I know for a fact that this is public because you can go to web archive. Essentially, when Artisan AI first launched artisan.co, if you go back to the web archive and you go back to when they first launched the website, the marketing copy was almost a one-to-one match with our copy at the time at 11x. We noticed that, we picked up on that, we laughed about it.

I think that philosophy that Artisan has of just trying to get to feature parity at every step of the way and that philosophy of copying the work of others, in my humble opinion, if you set a culture like that from the top down, I don't know how that plays out. Obviously, I haven't worked at 11x for a very long time and maybe it's very different. Maybe Artisan AI has some different cultural shift. I think that actually innovating is not something I've seen from Artisan.

Client 00:15:18
Yeah. Innovation is relatively low. On the scale of team and then also just ability to ship product and build product, how would you rate Artisan versus 11x?

Expert 00:15:28
To do that, I would need to look at their code and then how fast they've ship-to code. I don't have access to that information. I don't think I'm positioned well to answer that question.

Client 00:15:39
Fair enough. Then to get an overview of your thoughts on Artisan versus 11x, it seems like it's essentially that 11x will always be one step ahead because Artisan is just copying 11x. There's no real core technological innovation or moat that Artisan has because it's essentially the same as 11x. Is that a good analysis or overview?

Expert 00:16:02
That is perhaps a stronger narrative than I would have liked.

Client 00:16:05
Okay. What would your narrative be then?

Expert 00:16:08
Artisan and 11x can both clearly move product at pace. If you really wanted to super DD it, you could just go back month by month in the web archive and then just look at the features that they're advertising. I think at some level, and from my time at 11x, Artisan got to feature parity a while ago.

I don't even think there's enough features to ship to stay one step ahead at all times. That implies that there are an infinite number of features to ship, and it's not. You can actually solve the AI SDR game. Eventually, they'll race to the bottom, but the bottom will stop. I think that's a more accurate position.

Client 00:16:46
If you were to bet your horse on one of them, who would you choose, and why?

Expert 00:16:51
In my personal opinion, I would probably bet my horse on 11x.

Client 00:16:55
Okay. I'm more interested in the reasoning. What are the key KPIs or comparisons that you made to get to that decision?

Expert 00:17:03
There's an interesting wild card to consider that I think it's hard to find this information online because it does exist. If you go to 11x's LinkedIn and you look at the average tenure and you can see that people are leaving. If you dig deep into it, you'll find out that there have roughly been as many people that have quit or have been fired as there are people that have joined. **The employee churn at 11x seems really, really high**. I think **this is a tail risk** that people don't really consider, but it's definitely something to think about. I think Artisan AI seems a little more stable in that sense.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:17:39

I'm curious. You obviously worked there, and no need to share anything that you're not comfortable with, but is there a reason why **people are churning a lot**?

Expert 00:17:48

Yeah. A couple of quick reasons that are obviously publicly available. It's an extremely intense environment. Not just by the metrics of techies because they're lazy. Actually by any metric. I was pushing 120 hours a week for about five months straight during the initial scale-up phase. A lot of that, **it was intense, but unnecessarily so and unpleasant**. I think the reason for that is as communicated by other people who have left and written about it and things like that, it's a top-down kind of cultural phenomenon, let's say. I think the founder is a very intense person.

Client 00:18:24

Founder intensity can obviously be great. If the founder is motivating the team and shipping product faster, it can be sometimes deleterious to the culture and the motivation people feel. Do you think that it's a net positive or a net negative to 11x as it relates to the competition of Artisan?

Expert 00:18:43

Absolutely a negative. This is my random, unsubstantiated opinion, but if me and the co-founder, because there was a co-founder, which seems to have been scrubbed from history a little bit. If Austin and the initial engineering team were still there, we'd be probably a lot further ahead in my opinion. The reason for that is a couple of things.

Typically, in engineering teams, you have a process of documenting the code because, as I said earlier, the pursuit of building products is extremely esoteric and there will be knowledge. Tribal knowledge will leave and evaporate. Non-technical people do not understand this and do not understand how critical it is to alleviate tech debt and then also document code. At the speeds of which we were moving products, there was no room for documentation. Literally, if you propose documentation, you would get laughed at. I say that in a tricking way because that's not the priority. We need to share values.

It does create an element of mistrust. If you imagine that company, **it's like this social network and the edges between the nodes are a little bit fucked in terms of people distrust each other,** and it goes everywhere. I think I liked the compounding effect and mix of social relationships. They were really, really advanced in terms of building a long-term business.

Client 00:20:03

Yeah. Did you leave for the intensity reasons?

Expert 00:20:06

I left because **intensity was certainly a pressure builder, but the inflection point** was a contractual integrity issue. I think honoring contracts is very, very important.

Client 00:20:16

Was that specific to you, do you think, or was that happening across the firm?

Expert 00:20:21

That was happening across the firm. That's right.

Client 00:20:24

That makes sense. Wrapping up this point, and then I just have one more last question. There's obviously a lot of churn, **intensity issues at 11x** that Artisan doesn't have that 11x definitely does have. That's one point to consider. When you're comparing Artisan and 11x, are there any others to consider? You did say that you'd bet on 11x. I'm curious, what else went into that decision of which one you choose?

Expert 00:20:51

The thing to note is that 11x is explicitly positioned as trying to automate just knowledge work, full stop. I know that Artisan is also trying to do this, but from my experiences and also marketing material, it does seem to be a little bit more core to the identity of 11x to go after all of

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

these verticals. It's hard to tell.

Client 00:21:12

Verticals being like HR, sales, marketing, basically verticals larger than sales. Whereas Artisan is only focuses on sales?

Expert 00:21:19

Yeah. Artisan is also focused on these other things, but in terms of product velocity, they have only shipped the outbound ***AI SDR***, but ***11x*** does seem to have a bit more movement. They've got Jordan, which is a phone rep, which I suppose is also like outbound SDR, but it's a completely different workflow. There seems to be more actual action towards that vision on the side of 11x. I don't know. Obviously, they're both racing toward it. We'll see.

Client 00:21:48

Got it. It seems like, obviously, you don't have knowledge of Artisan, but from the 11x side, **they may be building faster, but also there's the negative of the cracks in the culture**. That's the pro and con is what you're saying?

Expert 00:22:02

Yeah. I think cracks in the culture, but also really at all levels of the business. They've churned two CTOs and one de facto CTO, and then three de facto head of engineering. I think it's more than a crack.

Client 00:22:15

Yeah, fair enough. Last question is, I'm curious just on your thoughts of the actual product market fit for ***AI SDR***. We've heard that the writing across both Artisan and ***11x*** just isn't good enough yet. I am curious on your thoughts on if you see the writing and then also product market fit in general getting better and over what timeline.

Expert 00:22:37

By writing, do you mean like marketing copy?

Client 00:22:39

Yeah, marketing copy.

Expert 00:22:41

I love this question. I think that generally speaking, across the industry, **people have been seeing cold emails as a lead gen strategy declining in success for two key reasons**. Firstly, it's very easy to now generate personalized emails at scale. Secondly, Google have actually implemented more stringent spam protection over the last couple years.

Basically, when you use the 11x product, you need to go connect your Gmail inbox so that Alice can start sending these emails.Google made a change to their authentication methods **that made deliverability of low-reputation domains pretty bad**. It hit the deliverability rate pretty bad. What that means is that you need a high domain reputation to run these campaigns at scale.

The success rate of those campaigns has been reported across the industry to be lower. What do I think that means for the industry as a whole? I think that means outbound sales strategies are now going to trend, in my opinion, towards delivering a lower volume of messages, but having them really precise and really personalized. I don't mean like those shitty one-liners that say like, "Yo, we went to college together." I'm talking about really deeply, personal, trigger-based messages.

Scraping buyer intent from loads of different data sources, and very unconventional ones, and aggregating them. Here's a good example, there is a channel which is, if **someone leaves a bad G2 review on a competitor's product on like their G2 page, then you scrape their contact details, reach out to them and say, "Hey, heard you had a bad experience with competitors products**. Would you like to try ours?"

That's an example of a data source that is being fully automated and processified and actually integrate. I forgot what it was, but there is a SaaS product on the market that has that workflow that I just described as a channel. I think the trigger-based sales and trigger-based channels and delivering a low volume of emails, but they're deeply personalized is the way forward.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

Client 00:24:44

Do you think that there's then not product market fit for 11x or Artisan because essentially the market's going to move a different way?

Expert 00:24:53

I think that's a plausible sentence and claim. I don't know what we're defining here as product market fit. It's also very hard to fit.

Client 00:25:01

Yeah, maybe it's easier to use in the context of writing. We've just heard from a few customers who've trialed both products who've said, "AI SDRs seem great, but **the product isn't actually good** enough yet for our use case." The question was, do you think that the product does get better to specifically use their use case?

Expert 00:25:21

Yes. I do believe that as the foundational models that these companies are using, as the underlying technology gets better, I do think that **the success and ROI of these products will increase**, for sure. The reason why I said I don't know what you're defining as product market fit is because **I'm skeptical of the implicit claim** that 11x has found product market fit. I'm personally skeptical. I don't believe that to be true. I don't believe anyone really has found it in this space.

Client 00:25:51

I agree with that. I'm curious why you think that. Why don't you think AI SDRs have found product market fit? What indicators lead you to believe that? How do you think they will?

Expert 00:26:02

It just comes down to the reply rate of the campaigns that Alice is running relative to the cost of hiring Alice. I'm sure that if you ask that question and 11x was priced at a 1/10 of the cost, they would probably say, "It's working great." I think it's relative to how much they're paying. 11x clearly has a premium on their contracts. They also have implemented this thing where you only get one or two calls, and then after that, you literally have to sign. Recently, they've implemented that. There's a lot of customers report that for prospects. There's a lot of premium on the sales process and there's a premium on the price of the product too.

I think whether the customer is finding value in the products, I think it's a large partial portion of that is relative to how much they're paying in the cost. If you were to run Alice's outbound campaign of infinite scale at zero cost, I'm sure people would say it's great. I think that how you get there is just by having and it's more really about the data sources in my opinion. It's the inputs being more trigger-based and so really high buyer intent leads scrape from data sources that have not been mined yet. There's still a lot of alpha in those data sources. **It's a combination of those two things plus an increase in performance in the foundational models**.

Client 00:27:23

Do you think that the reply rate will increase? Do you think that there is the capability to increase reply rate and have this technology be a really high ROI technology for people?

Expert 00:27:35

If you want to play this 100%. If you play it out, the way I see the world in five years, 10 years is that the spray-and-pray model is completely dead. People just see what they want in their inbox all the time. Marketing intelligence is so good at that point. It depends on 11x's product strategy. If they buy this product strategy too and start implementing, then that's what you'll see. I do think that whoever the winner of this space is has a major focus on inputs, specifically relating to data and timing of outbound.

Client 00:28:08

What I'm hearing from you is fundamentally, the market will change. Product market fit doesn't just come down to increase in writing. It comes down to product market fit with the changes in the market. Is that right?

Expert 00:28:21

Yeah, 100%. Our sales industry has shifted majorly in the last three years. Before that, it was pretty much the same playbook for the previous 10 years, and only in the last years has it shifted massively. Buyers are confused. They don't know what's going on.
