Vice President at TTEC Holdings Inc. Believes *Agentic* AI Is Transforming the Healthcare *BPO* Industry

DATE PUBLISHED	INTERVIEW DATE	EXPERT PERSPECTIVE	ANALYST PERSPECTIVE	PRIMARY COMPANY
05 Oct 2026	30 Sep 2026	Competitor	AI Interviewer	CNDT

SMART SUMMARY

Summary

The conversation focused on the competitive dynamics, pricing, and technological disruption in the *BPO* industry, particularly in the healthcare payer segment. The discussion highlighted the impact of ***agentic*** AI on automation, pricing models, and the evolving strategies of major industry players.

EXPERT BACKGROUND

- Vice President of client services at a leading BPO provider, managing a nine-figure healthcare portfolio for a major payer and provider group; over 25 years of experience in the BPO industry, including 12 years at a major healthcare payer.

EXPERT SENTIMENT

- The expert views ***agentic*** AI as a transformative force in the ***BPO*** industry, with the potential to **automate a significant portion of Tier one and Tier two call volumes**, especially in healthcare.
- They believe **Conduent is well**-positioned competitively due to its advanced AI solutions, but note that trust in AI maturity and regulatory compliance are key hurdles for broader adoption.
- The expert expects rapid growth for providers with strong AI offerings, but highlights that **pricing power is limited and margin compression** is likely to continue.

TAKEAWAYS

- **Conduent and the expert's company are direct competitors in the healthcare payer *BPO* space, with significant overlap in services**, particularly around ***agentic*** AI.
- **Conduent's *agentic* AI solution is seen as highly sophisticated, capable of automating over 50% of Tier one and Tier two call volumes, and has won industry innovation awards**.
- The competitive landscape is crowded, with 17 main players, but Conduent's AI tool stands out for its multilingual capabilities and flexibility across industries.
- **Pricing power for BPO providers is minimal, with rates set by large payers and significant downward pressure** due to geoarbitrage and technology adoption; the shift to consumption-based billing increases client stickiness but lowers per-unit revenue.
- **Margin protection is challenging; providers relying on manual or FTE-heavy models face rapid margin deterioration,** and the industry is moving quickly toward AI-driven solutions.

Business Solutions at UnitedHealth Group, responsible for sitting at the UHG level, taking a line of business, aligning the business to a portfolio, building integrated business plans, assessing acquisitions, building through captive operations, and factoring in necessary benefits across the US market. - Expert reported to the SVP, 2 levels from the C-suite. - Expert is also familiar with Humana, Cigna, and Centene Corporation. - Expert is still working in the same industry.

Interview Transcript

AI Interviewer 00:00:00
Thanks for joining. The goal of today's conversation is to understand Conduent's competitive positioning, pricing power, and cyclicality dynamics through a peer's lens, focusing on industry structure and secular trends in the business process outsourcing or BPO industry. To get started, could you tell me a bit about your current role and what you're focused on day-to-day?

Expert 00:00:21
My current role is vice president, client services at TTEC. I manage the UnitedHealth Group portfolio for TTEC, which consists of UnitedHealthcare and Optum. That is the payer and provider tech and services space. It's a 9 figure portfolio account. Prior to my role as vice president of client services, I worked for Optum or UnitedHealth Group for 12 years.

AI Interviewer 00:00:49
Thank you. All got it. How long have you been in the BPO industry overall?

Expert 00:00:56
25+ years.

AI Interviewer 00:00:58
In your current role at TTEC, how directly does your work overlap with the kinds of services that Conduent offers in the market?

Expert 00:01:06
Conduent and TTEC are competitors within the UnitedHealth Group space. There is significant overlap, although we do not focus a lot on the back office. TTEC's focus is more on the voice and agentic AI, and that's where you would see the overlap.

AI Interviewer 00:01:25
What does that competitive overlap look like in practice? Where do you see Conduent showing up most often against TTEC in that space?

Expert 00:01:33
Most recently, I would say that Conduent has pitched a solution to UnitedHealth Group that's agentic AI, that is very sophisticated, that would remove the majority of Tier one and potentially Tier two member services calls in the payer space. When you look at that space, UnitedHealth Group, during their ramp season, when you look at an 80/20 rule of that Tier one to Tier two type of environment, there could be anywhere from 7,000 to 10,000 advocates at a Tier one. Just basic answering questions around what does my plan look like, how does it pay, etc. You have a Tier two component that could be anywhere 3,000-4,000 advocates. That's where the space that we would overlap, where we do not offer agentic AI, and where Conduent has a very sophisticated agentic AI in the payer space.

AI Interviewer 00:02:24
What percent of that Tier one and Tier two volume do you think a solution like Conduent's could realistically automate?

Expert 00:02:32
A couple of things. One is you need to take the regulatory requirements on the plans. There are certain plans that may not allow AI without intervention. There are a lot of things around AI currently. Secondly, this is long-winded, but as I'm getting to the point, I think you need to run a pilot on accuracy on the different plans and the different states or the different employers or individuals. While the questions may be the same, you're still going to be looking at plan types, coverage types, exceptions, etc. Prior auth thresholds would be an example.

For me to give you a specific answer, it's a safe bet, you could probably start a pilot of one million calls, and then as you look at the accuracy, you could go into anywhere up to two million or three million, four million or five million calls within a couple of months period. In my humble opinion, when I saw their tool, Tier one could be potentially fully removed, where **you would be looking at truly just the exception calls and potentially a high reduction in those exception calls**.

AI Interviewer 00:03:37

Even a rough range. Are **we talking about a 10%-20% reduction in headcount** or something closer to 50% or more?

Expert 00:03:46

50% or more.

AI Interviewer 00:03:48

What would have to be true for that level of reduction not to play out?

Expert 00:03:52

As you look at the plans and the premiums and the way the industry is moving, you're looking at more standardized plans. You're also looking at some of the products that United or the industry is offering was pay-as-you-go, or you have pay-as-you-go with simple coverage. You're getting, say, 80/20 coverage, 90/10, where they have the higher complexity of what they will cover, what they won't, what your deductible is. You're still looking at a member population of anywhere from five million to 20 million in some of those plans. It's still a significant coverage for that to take place.

AI Interviewer 00:04:29

Got it. Let's move to industry structure and competitive dynamics. How would you describe the overall competitive landscape in the BPO space serving large payers like UnitedHealth Group right now?

Expert 00:04:42

Currently, in the payer space today, between all of the large payers, Aetna, Humana, United, etc., there are 17 main players. They all offer anything from gamification and training to shorten training reduction times, **which is obviously a reduction in cost**. They're looking at agentic AI, or you're looking at Google Assistant, or you're looking at different things where your sentiment on the phone to drive the advocates to a higher productivity and a one call that's all type of a response.

The structure that I would see that's the differentiator for Conduent today is that their site, the product that I saw, and experience was referred to as Sidecar in the industry. That product was able to answer, unscripted, all the questions, and it was able not only to do that, answer all the questions from a payer's perspective and a member lens, but it was also able to do that within four different languages. You were able to also tell it that the time that you had to get to the number of questions, and what types of questions they were, and it stuck to the script.

AI Interviewer 00:05:50

Among those 17 players, how would you rank Conduent's competitive position relative to the top tier?

Expert 00:05:57

Conduent won the contest of the Global Innovation Challenge. It's published on LinkedIn.

AI Interviewer 00:06:06

What does winning that challenge actually signal about their competitive position in the market? Does it translate to contract wins?

Expert 00:06:14

It will be awarded in volume and use. Yes, contract wins there. They already have other payers on it, so you will see **the maturity of the product definitely expand and grow**.

AI Interviewer 00:06:27

Where would a skeptic push back hardest on that view?

Expert 00:06:31

Maturity of AI. Can AI be trusted? How do we know?

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:06:37
How do you see that trust gap playing out in actual procurement decisions? What does it take for a payer to move past that hesitation?

Expert 00:06:46
Proof of concept, a number of specific use cases through an AI review board, and look at the accuracy, not only from the way that it responds, but the empathy to the end user, the voice not sounding too computerized, etc.

AI Interviewer 00:07:00
How long does that proof of concept cycle typically take before a payer is willing to commit to a full deployment?

Expert 00:07:07
It depends on the number of resources the payer is willing to invest in it, anywhere from four to six months.

AI Interviewer 00:07:13
Got it. Let's move to Conduent's market position more broadly. Where do you see Conduent winning business, and where do you see **them losing it**?

Expert 00:07:24
I see **their footprint significantly expanding**. I can only speak to healthcare, so I need to make sure that we remain the focus there. **Conduent would be, in the payer space today, highly successful**. I also see them in clinical case management, as that tool could be deployed in any of the case management products that would be offered through a number of different providers, hospital chains, payers, even technology services. The other thing is that tech services, as far as tech support, what **I saw from their agentic AI would absolutely grow** in there. The travel industry would be another area that would be a use case that you could use it in, as well as retail and different areas. Their tool is highly flexible and highly sophisticated.

AI Interviewer 00:08:11
What's the magnitude of Conduent's current footprint in the payer space? Are we talking a handful of contracts or something more substantial?

Expert 00:08:19
I can't answer that. I'm not aware.

AI Interviewer 00:08:24
Based on what you've observed in the market, what would **you expect their footprint to look like, given the competitive dynamics** you've described?

Expert 00:08:31
You could probably see a 20%-30%, maybe even a 40% growth, based on the tool that I saw.

AI Interviewer 00:08:39
Over what time horizon would you expect that growth to materialize?

Expert 00:08:43
Relatively quickly, they were able to create a sandbox environment and get very specific things within a couple of hours and show real-life business cases or problem statements solved through their agentic AI. When technology can respond that quickly, it's just a matter of deployment. I would say you could see that within a 12- to 18-month period.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:09:05
Let's move to pricing power. How would you characterize the pricing dynamics in the BPO space for payers right now?

Expert 00:09:12
Repeat that question. I don't fully understand it.

AI Interviewer 00:09:16
Sure. When payers are negotiating contracts with BPO providers like Conduent or TTEC, how much pricing leverage do the BPO providers actually have?

Expert 00:09:27
None. You need to fall within a standardized rate.

AI Interviewer 00:09:32
What drives that standardized rate? How is it set?

Expert 00:09:37
UnitedHealth Group's procurement team has established those rates based on market standards.

AI Interviewer 00:09:44
How has that rate structure trended over the past few years? Has it been compressing, holding steady, or moving in another direction?

Expert 00:09:54
I've been with TTEC for two years. **That rate has gone down** between 20% and 40%.

AI Interviewer 00:10:02
What's been driving that compression?

Expert 00:10:04
Competitiveness, geoarbitrage, voice or accent neutralization, to where you can use India, for example, and it still sounds like an English voice. It's just geoarbitrage.

AI Interviewer 00:10:18
How does the shift toward agentic AI change that pricing dynamic? Does it create any new leverage for providers, or does it accelerate the compression further?

Expert 00:10:29
At this point, when I look at it, you're paying for utilization or consumption. The technology is able to research a larger database where an advocate or an agent is able only to answer to what they've learned within their training period and retain. The NPS would increase, the accuracy would increase to the member. Therefore, you would see that the knowledge base would expand, and then **you would see the expansion of the product across a larger plan base**, member base, etc.

AI Interviewer 00:11:00
On that pricing model shift, moving from a per FTE or full-time equivalent billing structure to a consumption or utilization model, how does that affect the revenue line for BPO providers like Conduent?

Expert 00:11:14
Let's focus on specifically for Conduent and compare it to TTEC, where **your agentic AI, your consumption model would be a lower cost per minute** because you're paying for technology and all of the different databases that it would need to access for knowledge

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

management, language translation, etc., versus when you add in a human component, then you would have human costs, training costs, and it's long term, where you're establishing and maturing a technology database.

AI Interviewer 00:11:42

What does that shift from FTE-based billing to consumption-based billing mean for the total revenue a provider like Conduent can generate from a given client relationship?

Expert 00:11:52

It established stickiness. You would not be able to pull out at that point because you've matured that AI library specific to their products and cost models. You can further drive cost around length of call, around length of answer, accuracy of answer, or do I need to transfer it and escalate it to a live person? They would control the entire cost model, versus when you have an FTE, you're not able to control that.

You're given a target or a goal of an actual handle time of a call, but if you're not able to answer the questions, **you have leakage or overage within that call, which cost either United or the BPO**. **I would see this saving** both from a selling proposition where unique selling point is that you're able to control cost, you're able to control quality, and with a manual individual, you're able to deliver against metrics instead of control against them.

AI Interviewer 00:12:48

You mentioned stickiness. What would it actually take for a client like UnitedHealth Group to switch away from a provider once that AI library is matured and embedded?

Expert 00:12:58

The NPS scores and quality. They would need to reach a certain average month over month, and once that's established and proven, then you would see the product stickiness maintained. The next product would be self-service post-agentic AI, where agentic AI could potentially remove the consumption model and push them to, say, an iPhone or an iPad.

AI Interviewer 00:13:21

We're about halfway through. Are we okay on time?

Expert 00:13:25

We're okay.

AI Interviewer 00:13:26

Got it. Let's move to margin defensibility. When pricing is compressing the way you've described, how do BPO providers protect their margins through the cycle?

Expert 00:13:37

Right now, there is no protection in the industry. The next partner or BPO provider will continue to find an AI tool that will drive manual labor in a Tier two or a Tier three geoarbitrage city, and leverage that environment or that labor market, and it will continue to drive that price point where if you were to look at a pure agentic AI solution, you would be looking at a consumption model, and then as the volume grows, you would be looking at potentially lowering it. You could take the total cost of ownership, and you could further reduce the total cost of ownership and drive a percentage year over year down with savings already baked in, knowing that the tool would mature in whatever that period of time that you would establish that contract in which a manual operation would not be able to compete with.

AI Interviewer 00:14:24

What does that mean for providers who are still running a largely manual or FTE-heavy model? How quickly do **their margins deteriorate?**

Expert 00:14:32

Eighteen months.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:14:35

What happens after that 18-month window? Do **they exit the market, pivot, or absorb the losses**?

Expert 00:14:43

It depends if the payers would adapt or bring on partners that would be willing to take on the lower rates and provide that level of service that they're expecting or for that rate would provide.

AI Interviewer 00:14:53

Let's move to cyclicality. How does demand for BPO services in the payer space hold up during economic downturns? What have you observed historically?

Expert 00:15:04

While COVID was something, an anomaly in itself, **the BPO space grew significantly**. When you look at that, let's remove the COVID environment because **all BPOs grew** there. When you look at the cyclicality in the payer space, you're going to have the open enrollment, which would consist of the telesales. We haven't really even approached in our conversation on selling or the scheduling of calls or the percentage of contact versus just outreach, versus average speed to answer. There are a number of items when you look in the sales cycle or telesales for the payer that you would be able to address, and **you could potentially grow the revenue from telesales in that space**.

When you look at selling the product, you're also looking at maturing it on the back end to be able to respond to what was sold, so you're not just re-establishing your model on responding to questions. You're basing it on the plan that was sold, and potentially, when you called in initially, they would have everything recorded on what you selected, and you're able to connect deeper with the consumer so that you're more relatable and provide them a better consumer experience end to end, from selling to supporting, all the way potentially into the provider space, to the revenue cycle component of paying.

AI Interviewer 00:16:21

How does that cyclicality in open enrollment affect the revenue stability of BPO providers? What does the off-season look like?

Expert 00:16:29

A typical training cycle is about eight to 10 weeks. **The challenge** that you would look at the cyclicality of the selling cycle is can an AI tool become licensed in selling an insurance product? You're looking at regulatory and compliance, or is there a way to hand off to confirm the sale, and do you agree to everything and have a live person take over the call? The selling cycle typically goes from October through November in that enrollment season. Once that enrollment season is over, it will go to, can I use my health savings account? How much is in my health savings account or my flex spending account? How do I get access to my specialty benefits? What are my thresholds on my prior authorization or my deductible? Can I get these surgeries done, etc. ?

A lot of those items you might be able to address in the selling cycle. I think that it's probably opinionated question, but you could send specific material. There are a lot of things that agentic AI could drive the consumer to a more end-to-end solution that you could really drive total cost of ownership down to where if the tool is established, one payer could really drive self-service through agentic AI and self-service on an app, and chat, and different things based on your responses. This would then remove the competitiveness of having 17 main players in that space.

AI Interviewer 00:17:54

Let's move to peer behavior. How are Conduent's competitors responding to the agentic AI shift? What strategic moves are you seeing from the other major players?

Expert 00:18:06

What I've seen is, let's compare that to TTEC, where we have broad solutions taking care of, "Hey, what are your current business problems? Let's address them one by one," where Conduent has gone to market, provided a solution that is able to support any payer, any question from a member services perspective. That was all that I was able to experience. Now, I don't know the depth and breadth of the tool.

Obviously, you're able to have that tool expand into multiple areas, like I suggested, retail, banking, travel. It was sophisticated enough that you would be able to expand it just as easily in those areas, if not quicker than healthcare because you do have the different questions that healthcare plans or a provider or a clinical setting may drive, where agentic AI would have a knowledge library that you only have to staff the models of a Tier two and Tier three in those areas.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:18:58

How are other large ***BPO*** players outside of TTEC positioning themselves in response to what Conduent is doing with ***agentic*** AI?

Expert 00:19:06

They're looking at ways of collecting data or accessing data. Within the healthcare space, the payer and HIPAA requirements do not offer a control. You're still looking at partnering with someone like in a Conduent or a hyperscaler that is driving like an AWS or a Microsoft or a Google solution to where they are the large data player and the data sourcer in that area. Until that is established, a BPO player really does not have the ability to drive a product that Conduent has.

When you look at what other people are doing, they're partnering with small or tech companies and driving similar solutions, whether it's translation services, whether it's a specific product, whether it's complex medical conditions. You do have other partners, maybe, that you could look up in the industry to see how many other agentic AI solutions there are in each one of those spaces. You could see the solutions that are succeeding, starting, and evaluate those in those areas for yourself. Conduent is well-positioned, and the BPO players, unless they partner, there is no stickiness, and there is no longevity.

AI Interviewer 00:20:14

Conduent has been divesting some of its transportation and government services businesses to simplify its portfolio. How do you think that kind of portfolio narrowing affects their competitive position in the BPO market?

Expert 00:20:27

Transportation services and those areas where the government used to have funding to support and establish and have the infrastructure, that market is extremely margin. It's penny margins or half-cent margins, and it's very wise. Looking at that industry, transportation is something that almost a kiosk can handle going forward. It's a smart move.

AI Interviewer 00:20:52

What's **the biggest risk to that strategic move** actually playing out the way you'd expect?

Expert 00:20:57

I would see the transportation industry moving to a self-help type of app on your phone, similar to Uber, similar to just tap with a pass that you would get on or whatever transportation mechanism you're looking at. Let's take Delta, for example. Delta knows what seat you're in. They know what movies you like. They know when you call in. They know what your status is. They're able to drive you to the right customer. They can proactively notify you of a flight change. **Their technology has become so sophisticated within Delta that there is no competition** to stay within that industry. Someone else has either provided the technology, or they've made the investment themselves.

AI Interviewer 00:21:42

Got it. Let me ask about the commercial BPO segment more broadly. How would you characterize client churn dynamics in that space? What drives customers to switch providers?

Expert 00:21:54

Price and quality.

AI Interviewer 00:21:57

When you say price, what magnitude of price difference typically triggers a switch?

Expert 00:22:01

15%.%.

AI Interviewer 00:22:04

On the quality side, what specific quality failures actually push a client to make that move?

Expert 00:22:10

A couple months of failure of metrics.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:22:13
How many months typically before a client acts on that?

Expert 00:22:17
Most contracts are written now where they can give you anywhere from a two-week to a two-month ramp-down period based on three consecutive months of missing metrics.

AI Interviewer 00:22:27
We're getting close to the end of our time. Let me ask about a couple areas we haven't fully covered yet. On the secular risk side, beyond AI disruption, what do **you see as the biggest structural threat to traditional *BPO* providers over the next three to five years**?

Expert 00:22:46
Agentic AI, obviously, as you mentioned, the adoption of AI into the end user. The adoption rate, you need to take into consideration because you need to adopt in or out when you hear the AI is being used. To get the adoption, you need accuracy, you need empathy, you need to make sure that it listens. That would structurally change the environment, and it would still bring in the competitiveness.

It's a business decision to determine whether or not, "Do you want to alienate your consumer around moving completely towards AI," or "Is the technology going to augment my workforce into where I'm only going to take these type of calls?" That becomes more of a company or a business decision versus a pricing conversation. That becomes, "What does my consumer want?" That becomes, say, a product or a company decision or business decision versus BPO driving or providing a certain price point. That's how I would see it going.

AI Interviewer 00:23:47
How do **you see that tension between full AI adoption and workforce augmentation** resolving over that three- to five-year window? Which direction does the market move?

Expert 00:23:57
It depends on what's already offered to the consumer. Within healthcare, **it's a slow**-moving environment. It's highly regulated. You'd be looking at an 18- to 24-month, even 36-month window. Within that 36-month window, you would be looking at more advanced AI solutions. If the initial deployed AI solution is not advancing with the industry, you would see some competitiveness there. Within the banking industry, largely, that's all moved towards AI. When you look at the travel industry, that's obviously highly automated self-serve as you look at it today. When you look at the auto industry, without service and sales, you can still look at the ability to meet someone's needs and sell. Largely, ***agentic*** **AI, within all industries, will largely impact any *BPO* services**, that are, say, not in a Tier two or Tier three city that is offshore.

AI Interviewer 00:24:57
One more area before we close on Conduent's management and their portfolio simplification strategy. How credible do you find that strategic direction, and what would **you expect the margin impact** to be as they shed lower margin businesses?

Expert 00:25:12
A) This is an opinionated guess, but when I would look at it is I would look at exiting markets based on my agentic AI capability cost to deploy and cost to maintain and can keep competitiveness versus what does that manual competitiveness look like a requirement continue to be.

AI Interviewer 00:25:31
What evidence would you expect to see in the market over the next 12 months that would tell you whether that strategy is actually working?

Expert 00:25:40
Multiple BPOs providing similar solutions and seeing **growth in those areas,** and having consumer experience grow and quality and accuracy within those use cases.

©2026, AlphaSense, Inc. All Rights Reserved. AlphaSense is a service mark of AlphaSense, Inc. All other trademarks mentioned belong to their respective owners.

AI Interviewer 00:25:52

Looking ahead, what's **the single biggest risk to Conduent's competitive position over the next two to three years**?

Expert 00:25:59

I think it goes for any solution, with the speed to market and total cost of ownership of the product and support.

AI Interviewer 00:26:06

What would change your view on that? What would you need to see from Conduent specifically to feel confident they've addressed that risk?

Expert 00:26:14

I would need to know more about Conduent's support staff, not just support, but their enhancements and what's driving that, how it's maintained, how it's secured, and then what are they pushing in the industry from a regulatory standpoint to advance it? There are a number of areas that you would need to take into consideration, and I frankly don't have enough knowledge of where Conduent is strategically moving their tools and their support and their regulatory releases, if you will, so they can advance in those areas.

AI Interviewer 00:26:44

Thanks for your insights today. I enjoyed our conversation and appreciate you taking the time to share your expert perspective. Have a great rest of your day. Goodbye.
